SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Step up to the head of course, to the University of Business College, located in the new College Building, 24 Post street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and READ THE COLLEGE JOURNAL, which will be sent free upon application. Address E. F. HEALD, President, Business College, San Francisco, Cal. 10v23up-3m

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to obtain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Dewey & Co. have discovered the secret of the pure cocoa of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other. Steep the market. Entire solidity, a delicate taste, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packages only at all Grocers, of whom also may be had Taylor Brothers, Original Homeopathic Cocoa and Soluble Chocolate. Sole Importers—Brick Lane, London. Export Chicago, Ill. 1625-17

**N. Seibert's Eureka Lubricators** for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3m

A COUGH, COLD, OR SORE THROAT, REQUIRES IMMEDIATE ATTENTION, as neglect oftentimes results in some incurable Lung Disease. "Brown's Bronchial Troches" are a simple remedy, and will almost invariably give immediate relief.

Owing to the good reputation and popularity of the Troches, many worthless and cheap imitations are offered, which are good for nothing. Be sure to obtain the true Brown's Bronchial Troches. Sold everywhere.

**UNIVERSITY OF CALIFORNIA.**—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. eeb9pft

THE VIZALTA DELTA has been recently enlarged, and is now one of the largest, best printed and most extensively circulated local weeklies in California. A new job press and material have lately been added to the office to meet the wants of a thrifty and growing community in one of the most promising agricultural districts of the State. E. M. Dewey, proprietor.

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation at once at or near home to introduce our new 7 strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Henderson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

**LADIES DESIRING TO PROCURE A FIRST-CLASS Sewing Machine** cannot easily mount any installment may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York. Good work at high prices if desired. 21v1-12mbp

**Opera Glasses, Pebble Spectacles, and Eyeglasses** of great variety, wholesale and retail. MULLEN, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

**CONTINENTAL Life Insurance Co.,** 302 Montgomery street, corner of Pine.

## NOTICES OF RECENT PATENTS.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

**FRUIT BOX.**—C. W. Weston, San Francisco, Cal. The object of this invention is to provide a cheap and convenient box or basket for the transportation and sale of small fruits and berries, so that packages of different sizes can be delivered directly to purchasers without handling the berries or fruit and thus injuring them more or less. It consists of two thin veneers crossing each other at right angles and turned up so as to form a box as is now commonly done; but by forming a sort of channel near the top, the ends of the veneers may be turned over a wire which serves to hold them together and may be of any length to suit any size of box instead of being confined as at present to one size, dependent upon the size of the fastening now employed.

**MINING SLUICE AND RIFFLE.**—C. J. Garland, Gwinn Mine, Calaveras County, Cal. The object of this invention is to provide an improved sluice or riffle for the purpose of saving the float gold and amalgam, which is now to a great extent lost from the difficulty experienced in bringing the minute particles into contact sufficiently close to insure amalgamation. This invention accomplishes the desired end by means of plates or semi-obstructions so placed as to cause a breaking up and diverting of the current from one side to another of the sluice.

**IMPROVEMENT IN STEAM PLOWS.**—Oliver Hyde, Oakland, Cal. This is one of the many patents taken out by the above named gentleman, all of which tend to the perfection of a steam traction engine and plow. The present invention relates to a novel construction by which the cutters are so attached to the frame work and driving power of the machine that each cutter shall have an independent movement vertically. This movement is intended to fit the machine for plowing over rough uneven ground, and is effected by means of a transverse sleeve upon the main driving shaft, by which the driving gears are kept in contact while the cutter shaft is allowed a motion about the main shaft as a center. The rear end of the driving shaft passes through a box which is provided with trunnions and moves loosely in a square opening in the frame so that the movement of each of the cutters is free and independent.

## Formation of Gold Nuggets.

Mr. C. Wilkison announced lately to the Royal Society of Victoria that gold, when placed in a solution of its chloride undergoing decomposition by contact with organic matter, determines the deposit of much or all the liberated gold upon itself. This fact, first observed by Mr. Daintree, he assumes as accounting for the formation of nuggets. Mr. C. Wilkison also found that copper, iron, and arsenical pyrites, galena, zinc blende, stibnite, wolfram, and molybdenite, also act as a nuclei for gold thus reduced, but that brown iron ore and quartz do not. These results have been verified by a critical inquiry conducted by Mr. C. Newberry, analyst to the Geological Survey.

Mr. W. Skey, analyst to the Geological Survey of New Zealand, has communicated to the Wellington Philosophical Society a number of experiments on the same subject. He eliminated the cases of wolfram, etc., as being due to the presence of soluble proto-salts of iron, etc., and therefore had only to investigate the metallic sulphides and arsenides. On pursuing the subject, to his surprise he found that cubes of galena were perfectly gilt when placed in solutions of gold, without the intervention of any organic matter whatever. This direct reduction he has also effected by proto and bisulphides of iron, sulphides of copper, the sulphides of zinc, tin, molybdenum, lead, mercury, silver, antimony, bismuth, arsenic, platinum and gold, and among the arsenides, mispickel and arsenide of silver. While allowing therefore that organic matter has had a share in the reduction of gold, he thinks that by far the greater portion of our gold and silver deposits, especially those situated in the deeper seated rocks and ledges removed from carboniferous strata have been wholly due to the deoxidizing effects of pyritous minerals.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

(Expressly for the Press.—Continued.)

The best practical assay of gold quartz, sulphurets, tailings, etc., is based upon the common method of pan washing or prospecting.

In addition to the tools and apparatus before described, a set of large decimal weights will be required. A very convenient set can be purchased of Justinian Caire, Washington street, San Francisco. They are the gramme weights in common use in France. They are cheap and always accurate, being adjusted before being sold, by the government officials, according to French law. The set is from one kilogramme (1,000 grammes) down to 1 gramme. The decimals of a gramme can also be purchased at the same place, but they are in a separate box. As this assay is of the utmost practical value to the miner, I shall describe it with the greatest minuteness.

It must be understood that this is only a working test. It does not give all the gold that is in the rock as shown by a careful fire assay; but what is of far more importance to the mine owner, millman, and practical miner, it gives what may reasonably be expected to be saved in a good quartz mill. In fact it is really milling on a small scale. It is generally very correct and reliable if a quantity of ore be sampled. The only operation which requires any skill is the washing, and that is generally well understood by those who are most likely to avail themselves of the instruction.

Take a quantity of the ore—the larger the better—and spill it into pieces of less size than an egg. Spread it out on a good floor and with a shovel, mix it very thoroughly, then commence shoveling it into three piles, placing one shovelful upon each in succession, until it is all disposed of. Two of the piles may then be put into bags and taken away. The remaining pile is then spread out on the floor, mixed as before, and shoveled in the same manner into three piles. This is repeated according to the quantity sampled, until the last pile does not contain more than 30 pounds of ore. What remains is then removed to the iron slab described in a former article, and by the aid of the iron ring and hammer, reduced to the size of peas. The whole 30 pounds is then spread out, and after careful mixing, portions are lifted with a flat knife—taking up the fine dust with the larger fragments—until about five pounds have been gathered. This quantity is then ground down fine with the muller, and passed through a 40-mesh sieve.

If the rock is rich, the last portions will be found to contain some free gold in flattened discs, which will not pass the sieve. These must be placed with the pulverized ore and the whole thoroughly mixed if the quantity is small; but if large, must be treated separately and the amount of gold calculated into the whole five pounds and noted, when the final calculation is made.

From the thoroughly mixed sample, two kilogrammes (2,000 grammes) must be carefully weighed out. This is then placed in a pan—or better in an evaporating dish,—and carefully washed down until the gold begins to appear. Clean water is then made to replace the dirty, and when the pan and the small residue are clean, most of the water is poured off and a globule of pure quicksilver (which must be free from gold) is dropped into the dish, a piece of cyanide of potassium in size equal to a cubic inch, is also placed with it. As the cyanide begins to dissolve, a rotary motion is imparted to the dish—best done by holding the arms stiff and moving the body. As the mercury rolls over and ploughs through the sand, under the influence of the cyanide, it will collect together all the particles of gold. When it is certain that all the gold is collected, the mercury may be carefully transferred to a small porcelain cup or test tube, and hoiled with strong nitric acid, which must be pure, or may be the acid of 30° B. containing some silver, described in the bullion assay of gold. When the mercury is all dissolved out, the acid is poured off, more nitric acid is applied cold, and rejected, and the gold is then washed with distilled water and dried.

The object of washing with acid the second time, is to remove any nitrate of mercury which might remain with the gold and which is immediately precipitated if water is first used.

The resulting gold is not pure, but has the composition of the natural alloy. Before accurate value calculations can be made, it will be necessary to render the gold pure and weigh it carefully. To purify the gold, it must be melted with silver, rolled out or hammered thin, hoiled twice with nitric acid, washed, dried and heated to redness. The manner of doing this has been fully described.

The method of calculating this assay is very simple. It will be observed that 2,000 grammes were weighed out. Let the 2,000 grammes represent a ton of 2,000 pounds, then each gramme will represent a pound avoirdupois or one two-thousandth part of the whole; and the decimal of a gramme, the decimals of a pound. Suppose the ore yielded by the assay just described, fine gold weighing .072 grammes, it must be quite evident that a ton of the ore would yield the same decimal of a pound; now as it has been found that a pound of gold is worth \$301.46, it is only necessary to multiply this value by the weight of gold obtained in grammes and decimals, to find the value of the gold in a ton of the ore.  $301.46 \times .072 = \$21.70$ .

## Ventilation of Mines.

## A Simple and Effective Method.

Professor Henry W. Whitehill, State Mineralogist, during a visit to this city yesterday, informed us of a new mode of ventilating mines which is now to be seen in successful operation at the Wilson mine, Pine Grove. The plan is so effective, and at the same time so simple and cheap, that he thinks it should be generally known, and having seen an article upon the subject in the *Enterprise*, in which it was stated that the blowers at the Yellow Jacket mine, Gold Hill, are run at a daily cost of \$50, he came up from Carson on purpose to examine the means of ventilation in use at the various works, and to make known the plan which has worked so successfully in the instance named above.

The main shaft of the Wilson mine is 175 feet in depth, and from its bottom a drift has been run a distance of 1,000 feet. The air in this tunnel was formerly so foul that it was almost impossible for workmen to breathe it. All manner of plans for its ventilation were tried, but with little success. The last experiment made, though a failure, suggested the one which finally proved a decided success. It was the connecting of the air-tube leading down the shaft and back to the face of the tunnel with the smoke-stack of the hoisting works. This did but little good. The next thought was to insert the end of the escape pipe of the engine into the end of the air-tube, an elbow being formed in the latter and the end of the escape pipe being allowed to extend within two or three feet of the top of that portion of the tubularising perpendicularly above the elbow. This proved a grand success from the start. The foul air was at once driven out of the mine, and from that day to this there has been no trouble about ventilation. Every puff of steam from the escape pipe is answered by a corresponding throch at the end of the air-tube, nearly 1,300 feet away.

When a blast has been fired, the miners can now return to their work as soon as the flying rocks have fallen; whereas, formerly, the powder smoke proved a very great hindrance. The air at the end of the tunnel is now always just as cool as it is upon the surface. The Professor is confident upon trial that this single expedient will be found quite as efficient in our mines on the Comstock as in the Wilson mine at Pine Grove. To try the experiment here will cost a mere trifle. It will only be necessary to add to the air-tubes attached to the present blowers a length sufficient to reach the escape pipe, where the connection is to be made.

The air-tube used at the Wilson mine is six inches in diameter; escape pipe about three. It would perhaps be well to pay some attention to these proportions in trying the experiment here, though we are inclined to think that the end of the air-tube might be made still larger in proportion to the diameter of the escape-pipe. The greater the diameter of the outside pipe (the inside one always remaining the same size), the greater must be its height above the top of the inside one; yet, it can be made too high to act vigorously, owing to the resistance of the column of air above the point where the steam is discharged from the escape pipe. We hope some of our mining companies will try this plan of ventilation. It will cost but little, and in case it is found that this pumping-out plan will not work, it is only necessary to set the blowers running and fall back upon the old way of pumping in.—*Virginia City Enterprise*.

## THE LIBERAL CLUB OF NEW YORK CITY.

By OUR NEW YORK EDITOR.

New York is as prolific of creeds, clubs, religions, and theories as Dame Nature was fabled to be of life, in the olden time. According to the ancients the hot, rich soil in unknown regions beneath a tropical sun, gave birth to all manner of wonderful monsters.

Among the latest products of our mental soil—which to say the least is hot, if not rich—is the "Liberal Club." Perhaps the best idea of what it is, and what its objects are, can be gained from a statement of the elements of which it is composed. Among the members there are scientific men, literary men, believers in the Bible, believers in nothing, doubters, followers of Darwin, men who hold a theory of spontaneous generation plausible, men who think God a sufficient cause for the external world, rare Christians, ripe sinners, scholars, poets, mathematicians, idlers, workers, thinkers who talk, talkers who don't think, and in a word it is a society composed of the best representative men that can be found, or as they think themselves, the cream of New York minds. It must be confessed that when one considers who they are, their opinions seem plausible.

They meet at stated intervals, bringing up subjects for discussion from all departments of human knowledge, and usually managing to provide brain enough to make their meetings valuable, witty, and interesting. Few societies do as much.

Having among its members men of all possible creeds it is generally sure to get views from all possible sides. So it is not uncommon for the theologian to ask questions of the steam engine man; nor does it excite surprise when political economy answers questions propounded by the chemical man. Members, for a wonder, don't seem to confine their interest to their own special hobbies, and if their past nag don't happen to be showing his paces, may even then show some decided interest in the matter going on.

What the club may come to in years to come, we cannot say; but this members look very wise when the future is mentioned and insinuate great things.

The club was two years old on the 14th of September, and of course celebrated its birthday.

Plympton Hall was the scene of the celebration. On the first floor there was an Art collection. Bought, borrowed, and donated art treasures decorated the room and made a pleasant introduction to the programme up stairs. On the second floor was the "Scientific section," and on the third the "Philosophical and Literary section." The exercises in the sections were somewhat varied. In the first they were mostly short papers on scientific subjects. One poor fellow with a wondrous display of self-esteem, read a long dull paper on Hygiene, which interested nobody. All that was in it sounded so fresh from the text book, that one could almost doubt whether it had passed through his brain at all. The other speakers confined themselves to eight minutes each.

In the Philosophical section there were addresses, recitations, music, poems, etc. Everybody attended these exercises, and all the rest who could not get in went down to hear what the philosophers had to say to each other. After they were through on the upper floor the "Scientific" section had matters all their own way, and had a large audience until midnight. Among the curiosities over which the crowd of ladies were mostly exercised were, a bowl of snags made from an old napkin, a bottle of syrup from the same, coffee, (imitated) from the same source and sweetened with the sugar. Then there was the famous resurrection flower, which was the subject of a light minute discourse; but we must not try to make a catalogue of them all.

The ladies beamed on everybody, and the learned doctors were delightful, and everybody went home and wished for a long life to the Liberal Club and—a long sleep next morning.

One of the addresses from the Literary and Philosophical sections, was given in our issue of October 21st.

## USEFUL INFORMATION.

### Composition of Milk—Butter Globules.

Natural milk forms a liquid containing salt, sugar, casein and fatty globules. The three former are in solution, while the latter, from which butter is formed, is held in suspension, and not in solution. These fatty globules would soon enter into and form a part of the solution, were it not for the fact that they are contained in and protected by membranous envelopes. Were it not for this peculiarity of the fatty globules or butter being contained in cells or sacs, a very good article of artificial milk might be made; but as it is we must renounce for the present, and probably forever, all pretensions to the possibility of such an artificial fluid.

The separation of butter from the milk is simply the breaking of these membranes, and the agglutination of the contents of the individual cells into masses. The microscope distinctly separates and reveals the existence of these butter cells. If we examine with the microscope the milk, soon after the process of churning has commenced, we see the globules still retaining their form, dimensions and aspect. If we make our examinations a little later, we behold minute, irregular masses of butter floating in the body of the milk; still later we notice that these minute masses are aggregating and forming larger ones, like a snow ball gradually increasing by being brought in contact with new particles of snow, until at last we have the mass of butter—the object of the operation. The object of the churning is to break the membranes, so that the aggregation may go on.

To the contrary of the above, however, perhaps it should be stated that Dubrunfaut, a French author, denies that the butter in milk is enclosed in a membrane surrounding the globules; since he can produce, by emulsifying a fluid neutral fat in a slightly alkaline fluid like the whey of fresh milk, a liquid closely resembling milk and showing under the microscope, butter globules. He proposes to make an artificial milk by dissolving in half a litre of water, 40 or 50 grms. of saccharine material (milk-sugar, cane-sugar, or glucose), 20 to 30 grms. of dry albumen (prepared from dry white of egg), and 1 to 2 grms. soda crystals; then to emulsify therein 50 to 60 grms. olive oil or other edible fat.

We believe that Mons. Dubrunfaut has never yet accomplished what he "proposes" to do, as above.

**ACIDULATION OF CHICORY WITH PEAT.**—Chicory is being extensively adulterated with peat, in Europe, and the French savans are endeavoring to discover a ready test for such mal-practice. Contrary to the first supposition, this has been found a very difficult work. On boiling peat with chloroform, a yellowish solution is obtained which, on evaporation, leaves a brittle residue, similar in all respects to bitumen. Chicory contains nothing like this. Hence Mr. Swarts reasons that the presence, in chicory, of a bituminous substance, is a certain proof of adulteration either by peat or some analogous substance. As chicory has come to occupy so important a place for domestic use in connection with coffee, it is proposed that a legal penalty shall be enforced upon this imposition.

**SUGAR AND IRON.**—It is well known that it has not hitherto been possible to transport sugar in iron ships; and at a late meeting of the British Royal Society, a discussion took place on this subject which elicited some curious facts with regard to the action of sugar on iron. During the discussion Dr. Calvert stated that he had discovered a very simple method which entirely prevented the action, and he had no doubt that henceforward sugar would be as safely conveyed in iron ships as in wooden bottoms.

**WHAT WOMEN EAT.**—It is a popular belief that women eat nothing. It is of course conceded that they sustain life by the consumption of some article of nourishment; but eating, in the whole acceptance of the word, is supposed to be foreign to female nature. This fallacy is founded and sustained by women themselves, who, during the affected period of their lives, cultivate small appetites as being of semi-angelic construction. When this pernicious nonsense is conscientiously carried out, the results upon the would-be angels are squalor, red noses, certain loss of vigor, general limpiness, and some other unpleasant consequences. But, as a rule, the smallest appetites at the fashionable tables are exhibited by those shrewd girls whose natural and healthy wants have been thoroughly appeased by secret stuffing. Need we refer our readers to the historical poem concerning Violante in the pantry, gnawing of a nutmeg bone, reminding them how she gnawed it, how she clawed it, when she found herself all alone?

All this is a direct decoit, however, practiced upon unsophisticated old bachelors, who, when they have made the dainty creatures theirs, find out by the butcher's hook, an ocular proof, what sturdy trencher-women they have married. Watch a healthy girl at supper, during the intervals of dancing; she consumes by installments four times as much as her partner, and seems, now the worse for it. Our experience tells us that women eat, in proportion to their weight, as much as men, and are no more fairies in this respect than in the matter of weight.—*Appleton's Journal*.

**ABALONE MEAT—A NEW ARTICLE OF FOOD.**—The shipment of abalone meat to this city promises to become a matter of considerable importance. There are engaged at present in the business of taking and drying abalones, on the coast of Lower California, quite a number of Chinamen, who manage to procure about six tons per month. The abalone is found attached to the rocks; and in extreme low tide in greater quantities than at any other time. The fish, covered by the shell, adheres to the rock as tightly as if glued to it, and is cut loose with a sharp instrument carried by the Chinamen. After filling a large bag with the meat, which is removed from the shell, it is carried to the place chosen to dry it, and is there treated in the same manner that a tough beefsteak is in a first-class boarding-house—that is, it receives a good pounding. After this hesting, the meat is thrown into a large kettle and boiled for a short time; then it is spread out to dry in the sun. After a thorough drying, it is nicely packed in strong sacks and shipped to San Diego, to here shipped from there to the Chinese merchants in San Francisco. The meat commands in this city from five to six cents per pound, and is used exclusively by the Chinese. A considerable quantity is shipped to China, where it is regarded as a great luxury, being only used by the better class of people in that country.

**MACHINE-WORK VS. HAND-WORK.**—A paper at a recent meeting of the Institute of Mechanical Engineers, on Self-acting Machinery for knitting bosiers, supplies another to the many striking comparisons that have been made between hand-work and machine-work. A skilled knitter, using the ordinary needles, will knit sixty loops or stitches in a minute; a frame-work knitter, with his hand-frame, knits about 5,400 stitches in a minute; but three of the self-acting machines, described in the paper, which can be attended to by one girl, will knit 40,500 stitches in a minute. After this, we need not wonder that Leicester can weave stockings enough to supply the world.

**IMMENSE QUARTZ CRYSTALS.**—A large number of immense crystals of quartz were found, in 1868, at Canton Uni, [Switz.?] the largest of which weighed 267 pounds; other specimens weighed as follows:—225, 210, 134, 130, 125, besides many smaller ones, but still of mammoth size. Most of these specimens were of what is known as smoky or topaz quartz.

**A HEAVY TAX-PAYER.**—A. T. Stewart, of New York, last year paid an income tax more than either one of twenty-seven States and Territories, and more than Arizona, Colorado, Dakota, Florida, Washington, New Mexico, Utah, Idaho, and Montana combined. Mr. W. B. Astor paid more than the whole State of Vermont.

**TWENTY-FIVE miles an hour** is shown, by signal service observations, to be the average velocity of a storm.

## GOOD HEALTH.

### A Remedy For Cold Feet.

It is always unfortunate for a person to suffer habitually with cold hands and feet. It indicates that the blood is indifferent in quantity or poor in quality, or that too little exercise is taken. There are many means of partially or wholly remedying the evil, which we will give:

1. Go barefoot in hot weather and expose the feet as much as possible to the direct rays of the sun when it is hot. This remedy may not always be agreeable or possible, but where it is, it surpasses most others. Most people have feet so deformed and miserably tender that the thought of touching the feet to the ground is almost terrible, but a little practice will make it pleasant. Children should go barefooted in summer. They will have more perfect and healthy feet if they do.

2. Lying with the face downward, with thin-soled shoes on, let some one pound the feet with a wooden mallet, not larger than an egg. Let the blows be of such force as are not unpleasant to hear.
3. Stamp with the feet on the hard floor when the shoes are on.

4. Dance an hour or more three evenings in each week. By this we do not mean attend fashionable parties, but the home dance, where dissipation and late hours are unknown.

5. Take a great deal of exercise of the lower extremities, such as walking, running, etc.

6. If you have not sufficient strength of your own, have some person, while you are lying on a couch, knead, percuss, stretch, flex, and extend the limbs in such a way as to draw the blood to them.

7. At night soak the feet in hot water for five or ten minutes, and then, after suddenly dipping them in cool water, have them carefully dried with soft towels and rubbed as hard with the bare hand as they will bear.

8. If you are dyspeptic, improve the digestion. A person with sound digestion is very rarely troubled with cold feet.

To the above add loose shoes, clean, dry stockings, and wholesome food.

**COLOR BLINDNESS.**—Mr. Monck, of Trinity College, Dublin, propounds a novel and interesting theory of color-blindness. The ordinary explanation is that the eye is not sensitive to certain colors; to which it is objected that a color-blind person sees the whole spectrum, and were the explanation true there should not be color-blindness to complementary colors—red and green for example. Monck bases his theory on the phenomena of accidental colors. Thus, if the eye be very sensitive to the excitation of the complementary tint, then this latter, appearing with vividness while the eye gazes upon the original color, is so combined with it as to give rise to the grayish tint with which color-blind persons so often confound colors. The brighter the light, the more quickly and vividly would the accidental color be produced. Another argument is, that color-blind persons rarely see accidental colors. According to this theory, then, the color-blind eye is one in which the complementary color is seen very vividly while looking at the primary color.

**POSTURE OF THE HEAD IN SLEEPING.**—It is a question among people who are unacquainted with anatomy and physiology whether lying with the head exalted, or on a level with the body is the more unwholesome. Many, consulting their own ease on this point, argue in favor of that which they prefer. Now although many delight in holstering up their heads at night, and sleep soundly without injury, yet we declare it to be a dangerous habit. The vessels in which the blood passes from the heart to the head are always lessened in their cavities when the head is resting in bed, higher than the body; therefore, in all diseases attended with fever, the head ought to be pretty nearly on a level with the body; and people ought to accustom themselves to sleep thus and avoid danger.

**FOR FEVER AND AGUE.**—A friend assures us that the following receipt is a sure cure for fever and ague: Half a nutmeg, grated; a piece of almond size of nutmeg, and half a pint of vinegar. Simmer until the almond is dissolved and drink when the chill comes on. This seems like a disagreeable dose, but our friend assures us that it is not nearly so unpleasant as the chills with which he was afflicted for several months, and of which he was cured by this prescription.—*Calistoga Tribune*.

## Suffocation by Gas.

It is curious that in spite of the general dissemination of information among the masses at the present day, there should be so many people entirely ignorant of the properties of illuminating gas. Every now and then some country girl goes to town for a holiday, puts up at a hotel, blows out the gas on going to bed, and is suffocated. These accidents have happened in every city of any consequence in the States, and several instances have been recorded by the press of San Francisco. Considering the danger of these mistakes, and the frequency of their occurrence, we think it would be as well for hotel proprietors to establish a rule that the clerk, or whoever showed visitors their rooms, should explain to them the proper method of extinguishing the gas light. The same end might be effected by putting notices on the doors of the bedrooms, insid-, but for the probability that those most likely to blunder might not know how to read. So many lives have been lost in this way, however, that something ought to be done to protect bucolic visitors from asphyxiation. We commend the suggestion to the hotel keepers of our cities generally.

**A MEDICAL PRESCRIPTION FOR THE BREATH.**—"From six to ten drops of the concentrated solution of the chloride of soda in a wine glass of pure spring water, taken immediately after the ablutions of the morning are completed, will sweeten the breath by disinfecting the stomach, which, far from being injured, will be benefited by the medicine. If necessary, this may be repeated in the middle of the day. In some instances the odor arising from carious teeth is combined with that of the stomach. If the mouth is well rinsed with a teaspoonful of the solution of the chloride in a tumbler of water, the bad odor of the teeth will be removed."

**SLEEP—THE AMOUNT WE NEED.**—What is the quantity of sleep which a reasonable man should be contented with? This is a somewhat difficult question. Tall and bulky people require more sleep than short and thin people, men than women; and all animals sleep longer in winter than in summer. Age, constitution, climate, occupation, and a variety of incidental causes, must be taken into consideration. In extreme old age, much sleep is required. Youth and young adults sleep, habitually, very soundly. The faculty of remaining asleep longer than is necessary, cannot be indulged in without impairing the strength both of the body and mind. In a state of health, the amount of sleep required to restore the nervous energy, averages, we conceive, from six to eight hours.

**FOR THE WHOOPING COUGH.**—At a late meeting of the Academy of Science, Professor Coleman narrated the effect that creosylic acid had in arresting and breaking up the whooping cough in his family. He placed the acid in saucers in the rooms. The change for the better was very decided. The creosylic was merely the anodyne form of the carbolic acid, and would have a similar effect.

The fact explains the beneficial effect of inhaling the air of gas factories for this complaint, as the air of such places is always largely charged with this acid in the form of a gas.

**TO PREVENT PITTING FROM SMALL-POX.**—An ointment made of charcoal and lard, applied freely over the face, neck and hands, is said to prevent pitting in small-pox; it should be used immediately upon the commencement of the disease, and continued until the fever has entirely ceased. This application not only allays the itching, but it appears to shorten the duration of the disease, while it leaves the patient entirely free from all blemishes; the charcoal prevents the action of light, and the lard that of air.

**SOMETHING ABOUT HYDROPHOBIA.**—Mr. Youatt, a famous veterinary surgeon, who has been bitten eight or ten times by rabid animals, relates that the crystal of nitrate of silver rubbed into the wound would positively prevent hydrophobia in the bitten. True or not, it is easily tried, and is not dangerous.

**EVIL EFFECT FROM HEAVY EAR-RINGS.**—Many ladies have ruined the shape of their ears by wearing heavy, massive ear-rings which not only spoil the shape of the ear by elongating it, but also produce headache and pain the face.

**QUICK EMETIC.**—A teaspoonful of mustard in a tumblerful of warm water.

# Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG,  
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally opposite Wells, Fargo & Co.'s.

NEW YORK OFFICE: 37 Park Row, Room 25. W. E. PARTRIDGE, Editorial and Business Correspondent.

## SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance.—For one year, \$4; 6 months, \$2.50; three months, \$1.25. Clubs of ten names or more, \$3 each per annum. \$5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

San Francisco:

Saturday Morning, Nov. 4, 1871.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, Nov. 1, 1871.—Legal Tenders buying 88½; selling, 89. Gold in New York to-day, 112½.

## Table of Contents.

Automatic Steam Vacuum Pump—III.; Metalurgical Works at Vallejo; New Mining Discoveries.....	273
MECHANICAL PROGRESS.—A new Combination Loom; The Screw Rudder; Engraving by Electricity; SCIENTIFIC PROGRESS.—Experiments in Chemical Dynamics; The New Explosives—Picric Powder; Heat of the Moon; Ozone; Sun Engine.....	274
CORRESPONDENCE.—Eureka and Adjacent Districts, Nev.; Rains and Climate of San Joaquin Valley.....	275
MINING SUMMARY.—Stock Exchanges and Market Report.....	276-77
Notices of Recent Patents; Formation of Gold Nuggets; On this Assay of Gold; Ventilation of Mines; The Liberal Club of New York.....	278
USEFUL INFORMATION.—Composition of Milk—Butter Globules; Acidulation of Chicory with Peat; What Women Eat; Abalone Meat; Good HEALTH.—A Remedy for Cold Feet; Suffocation by Gas; Sleep—The Amount We Need.....	279
The Alleged Wrong among Miners; Chemical Reduction of Ores; The Water Question.....	280
The Water Question—continued; Warner's Grape Picker—III.; Sad-iron Holder—III.; Barlow's Bedstead Fastening—III.; Photographic Views.....	281
DOMESTIC ECONOMY; Domestic Receipts; Mechanical Hints; Life Thoughts.....	282
The Mezquite Bean.....	284

## Mining Accidents.

Jas. Langdon, night foreman at the Belcher mine, Washoe, was badly hurt on the 26th ult., by a large lump of clay which fell from the side of the shaft, a distance of 400 feet, striking him on the shoulder, while he was fixing the bell wire in the shaft at the 800-foot level.

Hugh Jones, a miner, in the Yellow Jacket mine, received severe contusions and bruises about the back part of the head and shoulders, on the 24th ult., from a falling timber in the incline, in which he was at work.

Edward Wright, a miner in the Crown Point, was badly bruised and cut about the face, breast, and arms, last week, from the premature explosion of a defective blast in the 1,100-foot level. His injuries will not be fatal.

Two men by the name of Haskins and Malone were run over by the car, in the Blue Gravel Co.'s claim, Nevada county, Cal., last Tuesday, and were severely but not dangerously hurt.

## "THE ALLEGED WRONG AMONG MINERS."

We have received a note from Mr. H. T. Lamphire, foreman of the Terrible mine, Georgetown, Colorado Territory, in allusion to the article under the above head, which was published in our issue of Oct. 7th. Mr. L., who has had over 40 years' experience as a miner and foreman thinks that no person could be found against whom such charges could be truthfully laid. We trust that our correspondent may be correct in his surmise; but we are assured by the best authority that such "rumors" are current among miners, in certain localities, and it is for the interest of all that attention should be called to the fact, to the end that if any parties are making such improper use of their position, they may be made aware that public attention is called to the fact and sooner or later exposure must come.

## CHEMICAL REDUCTION OF ORES.

The above is the title of the last chapter (now printed) of Mr. J. S. Phillips's work, the Explorers', Miners' and Metallurgists' Companion, to be issued by Dewey & Co. in a fortnight. This chapter is a good illustration of Mr. Phillips's style of writing; he endeavors to bring his subjects within the comprehension of even those not familiar with chemistry, and the book will, from the parts we have seen, he what its title promises. We reproduce the introduction of this chapter which contains a good deal of information in itself:—

"All the metallic mineral compounds can be decomposed, and their metals reduced, by the wonderful powers of some one or other of the appropriate expensive chemicals; but, for beneficial purposes, we only require a knowledge of such as can be obtained at sufficiently low prices to be available for the profitable extraction of metals.

Fire and water are by far the most important; for the former will so change the constitutional form that the latter may dissolve that which would be otherwise insoluble (as when the insoluble sulphides are heated to volatilize the sulphur of the base sulphide metals, or form the non-volatile and soluble sulphate of silver); or when supplied with a suitable re-agent (as salt), give it a more tractable new form (as the soluble and volatile chlorides of base metals, or the non-volatile and insoluble chloride of silver), which can be readily beneficiated by one of the following processes.

The number of such beneficial elements are few, as all of the best (yet discovered) methods require but fire, sulphur, chlorine, oxygen, and sodium (or other alkaline metals or earths).

Thus, the same elements that were principally at work during the first hot natural stage of the formation of the earth itself—as described in Chapters I and II, Section I, of this book—again become equally efficient in art, when the substance is subjected to the more hasty treatment by fire, to produce the similar initial soluble or insoluble forms for final aqueous beneficiation.

In these fire and humid chemical treatments of metals and minerals, the following more salient facts may be advantageously remembered; for, as all the most valuable processes yet applied are founded thereon, your success will be the more easily attained.

1. When the powdered minerals, or the alloy of the sulphides of copper, iron, and silver, are roasted in a reverberatory furnace, under increasing heat, the copper and iron will be first changed to sulphates, and then to insoluble oxides; whilst the silver will not be oxidized, but will be only changed to, and remain in the condition of, a soluble sulphate, until a greater and sufficient heat volatilizes its sulphuric acid, and leaves the silver in metallic form.

2. If the above carefully treated charge be withdrawn just before the silver is thus freed, the sulphate of silver will be soluble in hot water, and can be run off; whilst the oxides of copper and iron, being insoluble, will remain in the solid residue.

3. Metallic copper precipitates silver from its sulphate solution.

A knowledge of the above simple properties enabled Ziervogel to apply the method in a most successful manner for the reduction of the somewhat peculiar matte and ores of the Mansfield Company, to which it is said to be better suited than any other method; but, for this reason, it is probable that it may have been too much extolled for general effectiveness on silver ores.

4. By roasting an ore of silver at sufficient temperature, with a suitable quantity of common salt, all the silver contained in the charge will be chloridized.

5. This chloride of silver is insoluble in water and in all acids, but may be readily dissolved in a hot and strong solution of common salt, (and in other alkaline liquors).

6. Metallic copper will precipitate the silver from this solution.

Augustin's process was founded on the principles exposed under the fourth, fifth, and sixth headings.

7. When the silver of any argentiferous ore has been chloridized, as under the fourth heading, it may be dissolved in a cold solution of hyposulphite of soda.

8. The base metal chlorides are soluble in hot water.

9. The silver can be precipitated from this solution as a sulphide, by adding sufficient polysulphide of sodium.

Von Patera's method is founded on the

principles enumerated under the seventh, eighth, and ninth headings.

The Becchi and Haupt process, as suggested by Dr. Percy, is governed by the solubility of the base metal chlorides in hot water, under the eighth heading."

## THE WATER QUESTION.

By A. B. BOWERS, CIVIL ENGINEER.

### Irrigation, Swamp Land Reclamation, Etc.

The exclusion of water from lands that are flooded; the furnishing of water where the supply is deficient; the interests of internal navigation; and the water supply of towns, are matters of greater moment to the State, prospectively, if not at present, than any other now claiming the attention of this people. They are of almost equal importance, and the interests of neither, should be sacrificed to the others. Private interests may all lie in one direction. Public interests cover the whole ground, and should be better guarded at the next session of the Legislature.

Want of time, and insufficient data, preclude a full discussion of this question, at present, and we shall attempt nothing further now, than a brief and somewhat discursive notice of its more salient points.

### Swamp Land Reclamation.

Those who have discussed the question of California swamp and tide land reclamation, have, heretofore, so far as their writings have fallen under our observation confined themselves almost entirely to the single problem of excluding water. Now, as these lands are, for the most part, even more valueless without water than with its present superabundance, it is obvious that any scheme for their reclamation, which makes no provision for irrigation, must be worse than useless. In their present unreclaimed condition, nearly all these lands are, for a portion of the year, of considerable value, for pasturage; and some portions yield large quantities of inferior hay. Shut off the water, and these lands, in most instances, suffer from drouth very soon after the rains have ceased to fall; and the fine light vegetable mould, of which the soil, in many places, is largely composed, drifts on the wind, like snow. Vegetation dries up, and the parched soil becomes almost, if not entirely useless for the remainder of the dry season, even when the uplands produce an abundant harvest, on account of their superior capacity for the retention of moisture.

In the latter part of June last, we examined with a spade, a piece of unreclaimed tule, over which a steamboat could usually float four months in the year. At the depth of a foot and a half from the surface, it was nearly as dry as powder, while the grass, even then was dry enough to burn. This land would remain valueless, of course, for any purpose whatever, until the subsidence of the coming overflow, next April or May.

### Irrigation.

Provide the proper irrigation for swamp land, or upland, and you change the whole face of nature. The drifting clouds of dust disappear. Crop follows crop in quick succession; three, four, five, sometimes even seven per annum, each more abundant than the solitary one that cannot always be grown without it; while the sun-baked soil, and withered grass of our pastures, give place to moisture and a perpetual green.

In some portions of Italy, where the amount of rain during the growing season, is greater than the total annual rainfall in California, something like four hundred dollars per acre have been expended for irrigation with highly remunerative results; the grass lands being made thereby, to produce from five to seven crops per annum, yielding from twenty to as high as seventy tons of grass per acre, and averaging about twenty-four; while the rental of these lands runs from twenty-five to as high as one hundred and ten dollars per acre per annum; a rental which could

profitably be paid for such crops, even here, as fifty dollars per acre per annum, has already been paid for irrigable land in this State.

When irrigation is considered essential, and where such stupendous results follow its application to well watered lands, of a character well adapted to the retention of moisture, it is difficult to overrate its value, impossible to doubt its necessity on the porous soils of our swamp and overflowed lands, lying as they mostly do, in broad, open plains, unprotected by woodland or mountain, and exposed to the hot winds from the parched uplands, which sweep down like tongues of fire, lapping up every hit of moisture, scorching and blasting every green thing.

### Hydraulic Engineering.

The reclamation of these lands, involves, therefore, the construction of levees, flood-gates, sluice-ways, dams, canals for irrigation, locks, feeders, ditches, flood-gates, etc., all of which, if unskillfully handled, are among the most troublesome questions of hydraulic engineering—the most difficult branch, and, with the possible exception of some rude attempts at architecture, the most ancient, in some of its forms, of all engineering works. With a record running back more than forty centuries, and with traditions coming down from pre-historic times, it has accumulated a vast amount of dear-bought experience, and, in the lapse of ages, has developed a science that now shrinks from few undertakings, however stupendous, for which the necessary funds can be procured to carry them on.

### Hydraulic Engineers.

To the skillful hydraulic engineer, the reclamation of these lands offers no serious problem, save that of expense. Unfortunately hydraulic engineers are scarce. For the last twenty years railroad construction has almost entirely superseded the construction of canals, and only a few of the old first-class hydraulic engineers have been able to find work. These are fast passing away. One or two of the most experienced are now in this State, one of whom, Wm. H. Bryan, has for some years past, made a specialty of irrigation, and doubtless possesses more information on this subject than any one else in the State, while few men anywhere, have had anything like his experience in handling water. Through his writings, mostly anonymous, and the experiments they have called forth in different parts of the State, our people have gradually been educated into an appreciation of its importance, and one after another are taking up schemes, which he has constantly recommended, since first presenting them, several years ago.

### To the Uninitiated,

the building of dams, levees, etc., seems a very simple affair, and, unfamiliar with the numerous expedients, and constant changes of plan, necessitated by continually varying circumstances and conditions, and unwilling to pay for skilled plans or supervision, they everywhere tread over and over again, the same beaten track, never once looking at the record, and therefore ignorant of the lessons to be gathered from the experience of their predecessors, grope their way as best they can, only to continually reduplicate the story of unsuccessful effort and disheartening failure; and this too in utter disregard of the advice of

### Theoretical Men.

as they sneeringly term those who understand the things whereof they, themselves, are ignorant. The work of reclamation is intrusted to incompetent hands, and when the floods come, broken levees, loss of unstable dams, frightful inundation, devastation and death, often repeated, forces them at last into the recognition of their error; and when the engineer is finally put in charge of the work, as in most cases, he must be, at last, it frequently costs thrice as much for repairs, as the whole would have cost, had it been placed in his hands, at first, while the loss from inundation would have reclaimed the land several times over.

### "The Best System

of reclaiming overflowed and tide lands," is that required by the exigencies of each particular case, which varies of course, with varying conditions. The simplest of all is that adapted to the lands near the mouth of the Sacramento and San Joaquin rivers, lying below the level of ordinary high tide; and consists simply of embankments of sufficient height and strength to withstand the highest tides of the wet season, with sufficient flood-gates to drain off the water as the tides go down. In the course of a few months, the land becomes dry enough, and firm enough for cultivation except where it is too low to be drain-

ed by the fall of the tides; in which case, the better way is, to wait for the water to pass off by evaporation. Thenceforth, irrigation will always be necessary except in the wet season, and perhaps at times, even then. This is furnished in abundance by simply opening the flood-gates so as to let in the tide. The salt water being heavier than the fresh, rolls along the bottoms of the channels, and only the river water flows through the flood-gates and over the land.

**Where High Water Barely Covers the Surface,** but little skill may be thought necessary for the construction of levees, sluiceways, flood-gates, or dams, except in very soft ground. This may sometimes be true. Instances frequently occur, however, even under apparently the most favorable circumstances, to test to the utmost, the ability of the engineer. To specify all these, and explain the procedure proper for each particular case, would require a treatise on hydraulic engineering of several hundred pages, while to specify them in part would but set pit-falls for the unwary, by leading them to suppose that no further difficulty lay in the way.

#### Dimensions of Levees, etc.

No constant figures can be given for the dimensions of levees, flood-gates, sluiceways, canals, or dams. They must conform to the requirements of each particular case, no two of which are precisely the same. Those suitable and economical in one instance, might be useless in another less than half a mile away; or, if adequate to the requirements of the case, might cost much more than another plan equally as good. The size of flood-gates depends, of course, upon the amount of water they are required to discharge; their plan, upon the varying conditions under which they are used. The size of levees, and dams, vary with the depth of water, nature of the foundation, and the weight and character of the materials of which they are composed; and again, with the danger of abrasion from exposure to winds, waves, currents, tides, heat, cold, etc. The varying details of their construction under all these circumstances, would fill a large volume. The details of catchment drains, so constructed as to serve for canals of irrigation, with their feeders, sluiceways, culverts, dams, etc., would fill another. The discussion of reservoirs, to which reference will soon be made, and of their locations, foundations, wasteways, gates, and details of construction, suitable and economical, in the great variety of circumstances and conditions under which they will be required, would make another.

#### All these Details

from first to last, are determined by tedious mathematical computations, based upon careful surveys, and the actual conditions of such particular case, and dams, costing more than \$100,000, may be lost, through the improper laying of a single stone. No one who has mastered even the alphabet of hydraulic engineering, would expect to see these matters exhausted in less than half a dozen volumes.

Those who purpose taking charge of this class of works are recommended to several years study of standard works, for *nowhere* has the old adage, "a little learning is a dangerous thing," been more expensively illustrated than in amateur attempts at hydraulic engineering.

#### Tyros Often Settle Without Hesitation,

questions which the experienced engineer decides only after a careful and thorough examination; and by so doing, they bring discredit upon the profession, through failures which should never have occurred; while on the other hand they are often unable to decide at all, in cases that would occasion an experienced engineer scarcely a moment's thought. The enunciation of a few simple axioms, illustrated by diagrams, would put humbug men into the belief that they could economically manage their own engineering, and thus under the guise of friendship deplete their pockets, and lead them astray.

#### One Single Caution,

however, is so easy of application, and of such importance as to justify its insertion, though it has already appeared in the SCIENTIFIC AND RURAL PRESS.

Some, perhaps all of the tide lands lying near the mouth of the Sacramento and San Joaquin rivers, are of a very porous nature, and until consolidated by drainage and settling, may not inaptly be likened to huge pieces of sponge, the edges of which are covered by a coating of clayey sediment, very nearly impervious to water. Upon the upper ends of some of the islands, sediment has accumulated to such an extent as to form quite a firm soil for several rods inland; while upon the lower ends,

it is simply a thin layer extending but a few yards from the shore. Where this sediment is of sufficient depth to reach some feet below the bottom of the ditch or excavation made in constructing the levee, and is of sufficient consistency at this depth, to keep out water, the levee may, if desirable, be located on the inside of the ditch; but, upon the lower ends of these islands, where the coating is only two or three feet in thickness, sometimes not even that, the ditch should be on the inside, otherwise, cutting through this impervious layer, it would admit water to the edges of the sponge, and the land inside would remain so saturated as greatly to impede, if not wholly prevent cultivation, until sediment is deposited in the ditch, in sufficient quantities to stop the water, which in many cases, might not be for years. Contrary to our recommendation, the ditch, in one or two instances, has, under these circumstances, been made on the outside, with results such as we foretold.

[To be continued.]

#### Barlow's Bedstead Fastening.

As often happens with inventions, some little improvement of an existing idea like the one we are about to describe, works a much greater revolution in its special branch than was at first perhaps anticipated. For many years we have been afflicted with inefficient fastenings for bedsteads that are continually getting out of order and breaking down, with the additional disadvantage of being a fastening in a more permanent sense than the inventor intended, for you can never take a bed apart without some trouble—and a hammer. The improve-

ment under consideration evidently does away with the aforesaid objections.

It has two plates, each of which is formed into a hook, the bottom one represented in the accompanying cut as C, and the upper one evident enough without a mark, it being on the opposite side of the rail. The latter is secured upon the upper edge of the rail, A, so that the hooked end shall extend beyond the end of the rail, the hook turning upwards. The upright part, A, to which the rail is to be secured, is provided with a recess so that the upper hook will catch into it. The other hooked plate is then secured in a similar recess which curves downward at the lower corner of the rail, and the plate forced up against the under edge of the rail and there secured, thus bending the rail between two plates. The lower hook is represented in two positions—open by the dotted lines. When closed, the hooked end is caught in the inside pin, B, and the lugs keep it from moving laterally, while a button keeps it from opening, and holds it firmly in position.

The inventor makes the parts of wrought iron, by machinery, and fits them on any bedstead. This improvement was patented through the SCIENTIFIC PRESS Agency by E. T. Barlow, of this city, and further information concerning it may be had by addressing him.

**THE CARSON ESCAPES.**—Of the 29 prisoners which recently escaped from the Nevada State Prison at Carson 17 have been re-captured, and of the 12 yet at large, one at least is thought to have perished, and the whereabouts of several others is so well known that they can scarcely escape detection. Roberts, one of the captured ones, says it is not much to get out of the prison, but the trouble comes after getting out.

#### Sad-iron Handle.

The cut accompanying this description is a representation of Tait's Sad-iron Handle which consists of a simple and convenient arrangement by which the handle can be removed from the iron when it is being heated, and again be replaced with equal facility when required for use.

It consists of a standard rising from the body of the iron and bent at right angles so as to extend backwards. A shoulder is formed on this horizontal part, having a screw. It would appear as if the single standard would not be firm, as if two were used; but such is not the case, for the single one is as solid as need be and answers all requirements. The handle is of wood

or other non-conducting material and is hollow. A nut or socket is fitted in its outer end, and with a few turns screws on to the part before described when it is necessary to use the iron.

The whole is a convenient iron handle, which can be readily removed and replaced without trouble. The invention was patented through the SCIENTIFIC PRESS Agency, by Alexander Tait of Sonoma, Tnolumne county, Cal., and further information may be gained by addressing him at that place.

#### Warner's Grape Picker.

This useful implement is intended to facilitate the tedious operation of picking grapes. It is made of iron and steel, and is very neat in appearance, combining in one instrument a cutting device and holding jaws for seizing the severed twig or stem.

It consists in the employment, in combination with the knife, of two pinching jaws, one of which is grooved longitudinally through its central line, while the projecting sides are formed into teeth for the purpose of not only giving greater holding capacity, but also of providing space for the stem or twig to occupy without entirely flattening it when the jaws are closed. These teeth also serve to hold the stem in front of the cutting-blade while it is being cut.

A, A, represent the handles, and B, b, the two jaws of a tool similar to an ordinary hand-punch. Secured by means of screws, to one side of the jaw, B, is a knife or blade, c, which in connection with the edge of the opposite jaw, b, will serve as a pair of shears. In severing the stem, it will be caught by the teeth and prevented from slipping from the lower jaw while it is being cut; and as the jaws close together it fills the hollow of the teeth, and is pressed into the longitudinal channel, thus giving a firm hold without completely flattening it, as is the case with plain jaws.

This implement is of especial advantage for picking grapes and other heavy bunches of fruit, too large to be held by the tension of a spring. To parties having large vineyards where grapes are used for manufacturing purposes, or for market, this tool is especially useful. It was patented by G. A. Warner, of this city, through the SCIENTIFIC PRESS Agency.

Parties desiring further information concerning this implement, may procure the same from inventor or C. W. Butler, at No. 537 Sacramento street, or of Wiester & Co., No. 17 New Montgomery street.

#### Wanted—A Geological or Mining Museum.

In a community where so much interest is taken in mining, it seems strange that no public institution or set of men have started anything in the shape of a Geological Museum. The community, it may be said, had its very foundations laid in practical geology; and millions of capital are now invested in mines, the character of which would be better understood by their owners if they were in a position to make comparisons so as to derive the advantage of much published matter, the only key to which lies in the specimen shelves of a well-ordered scientific collection. How many mine owners are there who are unable to distinguish between volcanic and sedimentary rocks? Of course it is not essential to mining to be versed in all scientific technicalities, but as it is a well established principle of Geology that rocks and minerals are the same the world over, as much as water, if the miner could compare that which he knows, in his own mine, with the things in his line of business, that he reads about, he would surely understand much better what he is about. Intelligence is the first principle of business.

There must and will be established in the city of San Francisco, a Geological Museum. Will the State do something towards it by giving the public the benefit of its own valuable geological collection? The bulk of which is not to be got at because room and shelves will cost a little money, while boxes and storage cost almost nothing.

In some things we are public spirited enough. Why cannot our ambitious representatives cause the city to furnish the lot and the State to supply a fund for this most meritorious purpose?

If the intelligent miners and business men will it, the thing is done.

#### Photographic Mining Views.

We had the pleasure, a few days since, of examining some twenty photographic views recently taken of the North Bloomfield Gravel Mines. The pictures, which were taken by C. E. Watkins, of this city, are really masterpieces of the photographic art, and present the most perfect and life-like representation of hydraulic mining which we have ever seen depicted on paper. The mines are shown from several different points, and distant views are given of the line of the company's ditches, their dams, reservoirs, etc.

These views have been taken to accompany and illustrate an elaborate report upon the mines, which has been prepared by Mr. Attwood, M. E., who is acting in behalf of a company of English capitalists, with whom the owners of these mines are negotiating for the sale of the same. The accurate distinctness with which they are shown, in connection with the topography of the country, timber, etc., is really remarkable, and affords another instance of the value of the photographic art in aiding the engineer to describe the progress and condition of his work. It is perhaps superfluous for us to state in this connection that these are among the most valuable and extensive hydraulic mines in the State.

**BLOODED SHEEP FOR JAPAN.**—A Japanese agent purchased of J. B. Hoyt, of Solano county, six thoroughbred Spanish Merino and two graded sheep for shipment to Japan. They went forward by the steamer of Wednesday. There are no sheep in Japan, and the government in introducing them is determined to have none but the best. Japan is making most wonderful strides of progress in both her material and social developments. The work so well begun seems to gather force with its onward progress—and America is her type.

## DOMESTIC ECONOMY.

### Usages at the Table.

A person who wished to observe "the proprieties," inquired whether it was according to good usage to gnaw the corn from the cob, or if it should be cut into the plete. Generally, though not always, matters of table etiquette are founded in common sense. A bird can only be properly enjoyed by picking it, hence good usage enjoin the use of the fingers in removing the flesh from the bones of a bird, while one who should take the bone of a beefsteak, or a mutton chop, in his fingers, would be looked upon as ill-bred. The only way to get the full satisfaction. out of green corn is to gnaw it from the cob, and though the operation, especially to a foreigner who knows it not, is not an elegant one to witness, as it is performed at the best-ordered tables. So generally is it conceded that corn should be eaten from the cob, that silversmiths now make silver green corn handles; these are thrust into the large end of the cob, and allow it to be held without soiling the fingers. It is rather an awkward matter to cut the corn from the ear at table, especially if the knives are not sharp. If it is to be eaten in this way, it should be prepared before it is sent to the table. The operation of eating from the cob is much facilitated by drawing a sharp knife lengthwise of each row, in such a manner that the hull of each kernel will be split. When this is done, the digestible, nutritious contents of the kernels will slip out, and the often tough hull be left upon the cob. Those whose teeth are sensitive or defective will find this a great help.—*Rural Home.*

### The Laundry.

The sticking of starched clothes to the smoothing iron is one of the most vexatious things with which the laundress has to contend. This is partly owing to the adulterations in the starch, for which there is no remedy but to obtain a good article. Starch gloss is used more to prevent this sticking than for the glossy surface which it pretends to give. The latter is rarely, if ever, obtained in perfection without polishing iron and machinery. So, dear ladies, do not waste your time and strength in pursuit of it.

I learned this from a woman once employed in the laundry of a shirt and collar factory. She said also that the only gloss they used was hard soap. They shaved it off and boiled it up in the starch, and she used in her washing a piece as big as a nickel cent to a pint of starch. She starched her wet clothes in this, dried them, and then if wanted very stiff, dampened them by dipping them into cold starch in which a little soap had been dissolved, spread them between dry towels, rolled tight, for half an hour, and ironed smooth. I have long used this in various ways and find it always good. I prefer white soap.

If the clothes are already stiff I dampen by merely dipping them in soapy water. Care of the irons has much to do with success. They should not be permitted to stand on the stove to receive slops from the cooking. When not in use they should be kept in a dry place. If the face is once rust-eaten it is irretrievably injured. If rusted, however, rub them on emery or brown paper, but not on selt, as this tends to more rust. Beeswax may be used freely at any time, rubbing on the hot face of the iron, and then rubbing the iron thoroughly on cloth or brown paper. Some laundresses always do this before putting an iron to a starched surface.—*Home and Health.*

**HARDENING FATS.**—By melting soft fats in lime-water, and actively, stirring the same for two or three hours over the fire, then allowing the fat to cool, it will, in a day or two, become so hard as to be suitable for making candles. When re-melted it should be done with acidulated water to remove the excess of lime.

**A PRETTY ORNAMENT.**—Take a turnip, of convenient size and scrape out the inside, leaving a thick wall all around. Fill the cavity with earth, and plant in it some clinging vine or morning glory. Suspend the turnip with cords, and in a little time the vines twine around the strings, and the turnip, sprouting from below, will put forth leaves and stems that will turn upward and gracefully curl around the base.

### Why Boiling Milk Foams.

When milk is boiled its volume is very much enlarged, while water merely bubbles without any increase in bulk; why is it that the two liquids under the same circumstances behave so differently? When water is gradually heated to the boiling point the portion nearest the fire first reaches the temperature of 212 degrees, and the first particle that is heated to this degree is immediately converted into steam. As in its new form its volume is about 1,700 fold greater than in the liquid state, while its weight remains the same, it floats upward through the water, being held in a nearly spherical shape by the nearly equal pressure of water against it upon all sides. When it reaches the surface it is lighter than air, and consequently floats away in the atmosphere, and being invisible it is lost to our sight. The rapid formation of these little globules of steam, and their rise produces that peculiar disturbance of the liquid which we call ebullition or boiling. When milk is boiled, the same little globules of steam are formed but their surfaces are coated with an exceedingly thin film of the casein, which is one of the constituents of milk, and which has sufficient tenacity to prevent the bubbles from breaking when they reach the liquid. They consequently accumulate as they successively rise to the surface, forming the white foam which so frequently flows over the edge of the vessel into the fire.

**COOKING TOMATOES.**—The tomato is a vegetable that is hard to spoil, and it is generally acceptable even when rudely cooked. It is capable of so much change in the cooking as to afford a pleasing variety. One way of stewing tomatoes is to choose very ripe ones, skin, and slice, rejecting any hard parts. Put in a pan with salt, butter, and pepper, and cook very slightly, not more than ten minutes. Another way is to stew the tomatoes until thoroughly soft, rub them through a sieve, and then cook them down to the desired thickness. Butter, salt, and pepper, are the usual seasoning. Those fond of the flavor of onions will find that the addition of chopped onions while cooking, makes an excellent variety. Baked tomatoes are fine. Choose large fruit, and cut out a cavity at the stem end; fill this with a mixture of powdered cracker or bread crumbs, butter, salt, or other seasoning, set on a pan and bake until done. If managed carefully, the tomatoes retain their shape. Tomatoes may be boiled; cut them in halves crosswise and put them cut-side down, upon a gridiron over the fire. When the cut surface is seared, turn them and put salt, etc., on each, and cook with the skin side down until done.

**GRAHAM MUSH.**—Faith Rochester says: Does anybody want to know how to make Graham-mush? There are people who raise the best of wheat, year after year, and live on fine flour always, and have no idea how sweet, as well as healthful, the unbolting, or Graham flour is. Make Graham mush as you do corn-meal hasty-pudding, sifting the meal with your hand slowly into boiling water, stirring briskly meanwhile. A few minutes' boiling seems to cook it efficiently, though many cook it longer. Sweetened cream is an excellent dressing for it, and then if you add fresh herrings!—well, just try it! Many persons like it with unsweetened cream or milk, as they eat hasty-pudding. Wheaten grits are usually bought in paper parcels with directions for cooking. They are the wheat kernels with the outer woody fibre stripped off; and are excellent, especially for persons with inflamed stomachs who cannot bear the bran of Graham.

The neck of veal is rather a lean joint for roasting, and requires to be larded with bacon, or well buttered, and frequently basted. The scrag end must, of course, be cut away, so that six or seven chops only remain. An ordinary sized neck will take two hours' roasting. The larding is done thus: Cut some fat bacon into pieces two inches long and a quarter of an inch square; put the larding needle through the flesh about an inch and a half, then put one-third of the length of the piece of bacon on it, draw the needle out, and it will leave the bacon in the meat, about a quarter of an inch sticking up outside.

**FROZEN POTATOES,** if not permitted to thaw before being cooked, can be baked so as to be as good as though never frozen. They can not be boiled, however, nor even baked if submitted to the usual cleansing process of washing.

### Domestic Receipts.

**RASPBERRY VINEGAR SYRUP.**—One pint of juice, two pints of vinegar, four pounds and a half of sugar. Prepare the juice as usual, adding the vinegar with it. Strain the juice and boil to the pearl. A very superior raspberry vinegar is made by taking three pounds of raspberries, two pints of vinegar, and three pounds of sugar. Put the raspberries into the vinegar without mashing them, cover the pan close, and let it remain in a cellar for seven or eight days; then filter the infusion, add the sugar in powder, and finish in the water-bath. This is superior to the first, as the beautiful aroma of the fruit is not lost in the boiling.

**TOMATO CATSUP.**—This sauce being a universal favorite, the following recipe, for making it at home is worthy of notice. Several of our frugal house-wives have tried it, and it proved to be a success: Scald and peel 8 quarts of ripe tomatoes; add 1 quart of strong vinegar, 6 teaspoonfuls fine salt, 4 ditto sugar, 2 ditto black pepper, 3 ditto red pepper, 2 ditto ground cloves, 2 ditto allspice, 2 ditto cinnamon; let all boil together about two hours, stirring it often; strain through a sieve, and when cool bottle, and cork it tightly. Keep in a cool place and it will remain good for years. Any one who tries this experiment will be surprised at the large quantity of excellent catsup obtained for a small sum of money.

**MAKE YOUR OWN INDELIBLE INK.**—The cheapest material for marking linen is coal-tar diluted with benzine to the proper consistency. Another inexpensive prescription is to piece iron filings or old nails in strong vinegar; let them stand many days, and filter the liquid. Another way is to take equal quantities of vermilion and coppers, and rub them up with some oil varnish. The first and last preparations have to be used with a fine brush; the second with a common pen.

**TO PICKLE ONIONS.**—Take some nice onion and throw them into a tea-kettle boiler half full of boiling water, and let them remain ten minutes. Then take them out quickly and lay them between two cloths to dry; boil some vinegar with the ginger and whole pepper, and when cold, pour it over the onions in glass jars and tie them close over.

### Mechanical Hints.

**TO PREVENT THE INCORUSTATION OF GLUE-KETTLES.**—An exchange in speaking of glue-kettles, tells us of a simple improvement which will be of use to joiners, pattern-makers, and others using glue: "Every workman who makes frequent use of glue has been annoyed by the tendency of the glue which runs down from the brush to dry and harden upon the inside of the kettle—the incrustation thus formed sometimes reaching half an inch in thickness, or even more. To overcome this difficulty, three or four small holes should be drilled in the side of the kettle, close to the top rim. The kettle being set into the boiler, the steam rising from the water surrounding the kettle passes through the holes and keeps the interior of the kettle above the surface of the glue constantly moist. The glue which drips from the brush will therefore run down and rennet with the mass, instead of hardening and adhering to the sides, and the kettle is thus kept clean, however much used. The holes should be confined to one-half or two-thirds of the circumference of the kettle, in order that a place may be left at which to pour out the glue when desired."

**TO CLEAN OIL-PAINTED SURFACES.**—Take a piece of soft flannel, put it in warm water, and squeeze it till it feels dry; next dip it gently on to some very fine pulverized French chalk, and rub the painted surface with the flannel; the effect will be the removal of all dust, greasy matter and dirt; the surface is next washed with a piece of wash-leather. This method does not injure the paint like soap, and produces a very good result.

**TO WASH BRASS FIGURES OVER WITH SILVER.**—Take one ounce of aqua-fortis, and dissolve in it over a moderate fire one drachm of good silver cut small, or granulated; this silver being wholly dissolved, take the vessel off the fire, and throw into it as much white tartar as is required to absorb all the liquor. The residue is a paste, with which you may rub over any work made of copper, and which will give it the color of silver.

A bit of soap rubbed on the hinges of a door will prevent their creaking.

## LIFE THOUGHTS.

WHAT a man does is the real test of what a man is.

Be praised not for your ancestors, but for your virtues.

A HYPOCRITE is one that neither is what he seems, nor what he is.

Good qualities are incomprehensible to those who have them not.

MODESTY seldom resides in a breast that is not enriched by noble virtues.

How canst thou be a judge of another's heart that dost not know thine own.

PRICELESS as the gift of utterance may be the practice of silence in some respects far exceeds it.

In striving for the attainment of any object, the heart must be in the work for such attainment, and not set on the object.

HE is happy whose circumstances suit his temper; but he is still happier who can suit his temper to his circumstances.

SOME THINGS YOU WILL NOT BE SORRY FOR.—For hearing before judging.

For thinking before speaking.

For holding an angry tongue.

For stopping the ear to a tale bearer.

For refusing to kick a fallen man.

For being kind to the distressed.

For being patient to all.

For doing good to all men.

For walking uprightly before God.

For lending to the Lord.

For laying up treasure in heaven.

For asking pardon for all wrongs.

For speaking evil of no man.

For being courteous to all.

### Evil Speaking.

Speaking evil of others is one of the most unamiable habits that can be acquired, and one that leads to infinite mischiefs. It is not always easy to avoid, for there are a great many persons in the world who are not what they ought to be, who do many things that they ought not to do. It is hard for a blunt, generous mind to refrain from expressing itself about mean people and mean acts; there is something in meanness and dishonesty that rouses the indignation of such a mind and it likes the luxury of denouncing them in bold and unparing terms. But the practice, as a practice, is a troublesome and dangerous one. There are occasions when it is our duty to speak out in exposure of wrong; but, in general, it is best to abstain from speaking evil, even of evil persons. We are not made judges of others' actions; no one has the right to assume the character of arbiter and censor. Even the best of us has his faults, and if every one should presume to denounce the vices and misconduct of others, the world would be given up to defamation. We may see and hear much that we do not admire and can not like; we may become cognizant of many evil deeds done by evil persons; but it is the part of wisdom and discretion to pass them by without notice, unless speaking of them cautiously may be necessary as a warning to a friend. We all have enough enemies in this world without provoking others by ill-tempered comments. The enmity of evil men is a thing to be avoided, for while it can do us no good, it may do us much harm. Besides, we may make mistakes in the haste of honest indignation, and speak evil of good men for acts we do not understand. Such a mistake is worse than the other; for while it is impudent to promiscuously denounce evil men, it is a cruel wrong to defame a good man.

**CHOICE WORDS.**—Cherish thy mother; brief perchance the time may be that she will claim the care she gave; past are her hopes of youth, her harvest prime of joy on earth; her friends are in the grave; but for her children she could lay her heart gladly to rest among the cherished dead. O mother mine, grant I ne'er forget, whatever may be my grief, or what my joy, the unmeasured, unextinguishable debt I owe thy love, but make my sweet employ ever, through my remaining days to be to thee as faithful as thou wert to me.—*Bethune.*

It is not work that kills men; it is worry. Work is wholesome; you can hardly put more work upon a man than he can bear. Worry is rust upon the blade. It is not revolution that destroys the machinery, but the friction.

A word of kindness is seldom spoken in vain. It is a seed which, even when dropped by chance, springs up a flower.

## Business Cards.

**E. J. FRASER, M. D.,**  
SURGEON,  
No. 102 Stockton Street, San Francisco, Cal.

**JOHN ROACH, Optician,**  
Has removed from 527 Montgomery street to

## STEPHENS &amp; CO.,

MANUFACTURERS OF  
**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF  
**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.  
It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with math-  
ematical accuracy.  
The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.  
In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.  
By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
confining in a portable, useful and cheap form. "Scientific  
American."  
Price by mail, prepaid, \$4. For agents' terms, address  
**STEPHENS & CO.,**  
Riverton, Conn.

## THE MEZQUITE BEAN.

Two quite different trees are known by this name in those parts of the United States, south of lat. 35°, and west of the Mississippi river. We give illustrations to show the differences between them, by which it will be seen that the foliage is similar, and both are thorny, but that the pods are as different as any pods of the great *Leguminous* family of plants can well be. The trees themselves are similar in size, growing about 35 feet high, and spreading like apple trees so as to cover a width of about thirty feet or more, although this form is probably the result of the dry climate in which they vegetate.

Of the name "Mezquite" we can only ascertain so far that it means, in Spanish, a "Mosque," and may be applied to these trees as well as to a kind of grass, from the shape of their turban-like clumps.

These trees are distinguished by Americans as the flat or honey pod, and screw-pod Mezquite. Their marked botanical differences require that we give separately the history and description of each.

The Honey Mezquite—*Algarobia glandulosa*.

This tree was discovered by Dr. E. P. James, U. S. A., on Long's expedition to the Rocky mountains, in 1820, on the Canadian river, its northern limit, where it is only a shrub. Dr. Torrey described it in the annals of the New York Lyceum of Natural History, vol. II, p. 192, giving a plate illustrating its chief characters, by the name *Prosopis glandulosa*. But as the tree differs much from the East Indian *Prosopis spicigera* (of which the pods are eaten as a condiment,) the Spanish name "Algaroba" has been Latinized to apply to this and several more southern American species.

"Algaroba" itself is a second hand name, being the Spanish for "The Carob," a tree with pods used for food around the Mediterranean. In this we find also the origin of "locust tree." These pods were supposed by the early translators of the Bible to be the "locusts and wild honey" on which John the Baptist lived, they knowing nothing of the insect of that name, and therefore the Carob is called in Spain "St. John's Bread." Our eastern honey locust having sweet pods was supposed by immigrants to be a variety of the Saints' "Locust Tree." But as a botanical name for our trees, it is sufficient, not being used for the Carob by botanists.

The specific name is derived from little glands at the base of the leaves. The figure shows the characters of the leaves, flowers and pods. The latter are about 9 or 10 inches long, and contain about a dozen beans, surrounded by a sweet pulp as in the honey locust. Both beans and pulp are eaten by the Indians, and often by white men; but they are useful chiefly as food for horses, being produced in great abundance and requiring no preparation, as they eat pods and all.

The trunk has a diameter of 18 inches or more, but branches usually within 10 feet from the ground. It is however, invaluable for posts and many other purposes. Dr. J. M. Bigelow in Vol. 4 Pacific R. R. reports says: "Fences made of this timber in southern Texas have been known to stand in a perfect state of preservation more than fifty years. From its hardness and durability, no doubt but that it would make railroad ties equal to the lignumvite of tropical climates, to which it is, indeed, closely allied, belonging to the section Mimoseæ of leguminous plants." By sowing the seeds close together in rich sandy loam, there is no doubt that the trees might be made to grow much taller and straighter; thinning them out from time to time to make room, or using the saplings for poles etc. This tree also produces a valuable gum, resembling gum arabic, (the product of the related *Acacias* in Arabia,) and it is said that a large

amount of this gum is exported from Mexico.

As before mentioned, it is limited naturally by the parallel of 35° and though

one spot west of these mountains, at the borders of "Laguna Sal," between San Bernardino and San Diego, where it grows at least 15 feet high. It seems to grow in

THE HONEY MEZQUITE—*ALGAROBIA GLANDULOSA*.

widely diffused in Texas, is found west of the Rocky Mountains chiefly in the bottomlands of the rivers, most abundantly in the Colorado valley. It follows the Mojave

Lower California, and is said to grow 40 or 50 feet high in Mexico.

Dr. Bigelow found it growing in Arizona east of the Colorado river, latitude 34°

THE SCREW-POD MEZQUITE—*STROMBOCARPA PUBESCENS*.

River valley west to the foot of the Sierra Nevada, becoming gradually smaller until it is a mere shrub two or three feet high, at about 2,000 feet. It is known also in

at an elevation of about 3,500 feet, and as the winter is quite severe there as well as in parts of Texas, we are obliged to look to some other influence than cold for its

absence from most of California. This cause is probably our long dry season; for in Arizona the summer is accompanied by heavy showers, so that in many portions it is moister than the winter. Along the Colorado, the river usually overflows its bottom-lands in May, thus ensuring a summer growth.

It is therefore probable that with moderate irrigation this valuable tree would grow in most of the warm valleys of California south of San Francisco, and perhaps much further north, where it might not need watering. Whether the alkaline soil of most of its native regions, (and Laguna Sal,) is essential to its growth, is uncertain. Where it would not make timber it would probably make an admirable hedge plant.

The Screw-pod Mezquite—*Strombocarpa Pubescens*.

The remarkable form of the pods of this tree have given its English name, which is translated in the botanic name of the genus, and used also by the Mexicans in the Spanish form of "Tornillo." It does not seem to extend quite as far north, nor is it so large and valuable a tree. The pods, however, are good horse-feed, and are even eaten by the Colorado Indians, powdered to a coarse meal and made into a kind of bread.

The tree is very similar in form and foliage to the Honey Pod species, so much so that the able botanist Dr. Torrey finding the pods, together with the leaves of the latter, in Fremont's collection, described and figured them as a new species *Prosopis odorata*. (Fremont's Report for 1845, p. 313, pl. 1.)

Fremont mentions this tree as an *Acacia*, extending up the valley of the Rio Virgen, Arizona, to near latitude 37° and over 4,000 feet elevation. As he did not distinguish the *Algarobia* it is very probable that the most northern were that species.

Although the pods are so different, there are species of *Algarobia*, (or *Prosopis*), which have the pods twisted in various degrees from the nearly flat to the strongly twisted form.

## PATENTS &amp; INVENTIONS.

## Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

## FOR THE WEEK ENDING OCT. 24.

ROLLER SKATE.—John L. Boone, San Francisco, Cal., assignor to himself and Milton A. Wheaton, same place. Antedated October 3, 1871.

WHEELBARROW.—William McKibbin, San Francisco, Cal.

LOCOMOTIVE.—William D. Arnett, Denver City, Col. Ter.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

## New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

STICKEL QUARTZ MINING Co.—Capital stock, \$1,000,000, in 10,000 shares. Trustees: G. Palachs, Smith Brown, E. G. Wilson, C. E. McLans and C. Hartson.

MONTEREY WATER Co.—Capital stock, \$3,000,000, in 30,000 shares. Trustees: R. M. Shackelforde, C. S. Abbott, F. B. Boswell, J. S. Kennedy, A. B. Cathcart, M. P. Hall and J. Sroufe.

SAN LORENZO CANAL Co.—Capital stock, \$1,200,000, in 12,000 shares. The Trustees are the same as in the incorporation immediately above.

GLOBE MINING Co.—Capital stock, \$2,000,000, in 20,000 shares. Trustees: A. K. P. Harmon, J. D. Fry, J. C. Flood, C. B. Land, and D. A. Jennings.

NEWTON BOOTH MINING Co.—Capital stock, \$1,200,000, in 12,000 shares. Trustees: C. J. Hutchinson, J. B. Felton and O. H. La Grange.

EL DORADO MINING Co.—Capital Stock, \$1,000,000, in 10,000 shares. Trustees: T. Curtis, J. Roberts, Jr., J. W. Bost, F. O'Farrell and T. J. Owens.

SAN FRANCISCO AND TUNNEL MINING Co.—Capital stock, \$3,000,000: Trustees: S. B. Boswell, R. Cheney, T. H. Selby, P. Moroney, W. P. Pritchard, R. W. Thompson and J. W. Clark.

The following have filed certificates with the County Clerk, Sacramento.

TRY VALLEY CANAL, IRRIGATION AND MANUFACTURING Co.—Capital stock, \$10,000, in 10 shares. Trustees: J. Morrow, W. W. Hill and H. Dixon.

## Mining and Other Companies.

During the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—hence the very latest hour we can receive advertisements.

## Altona Gravel Mining Company—Location

of works, Grass Valley, California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 21st day of October, 1871, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office in San Francisco. Any stock upon which said assessment shall remain unpaid on the 4th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 26th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, DAVID WILDER, Secretary, Office, No. 21 Merchants' Exchange, California street, San Francisco, Cal. nov4-3w

ALTONA GRAVEL MINING COMPANY—LOCATION OF WORKS, Grass Valley, California. At a meeting of the Board of Trustees of said company, held on the 21st day of October, 1871, the order adopted on the 21st day of October, 1871, levying an assessment of 25 cents per share was rescinded. nov4-1w DAVID WILDER, Secretary.

## Eagle Quicksilver Mining Company—Location

of works, Santa Barbara County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of October, 1871, an assessment of forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any share upon which said assessment shall remain unpaid on Thursday, January 4th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, WM. D. WATSON, Secretary, Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. aug3d

## Highland Silver Mining Company—Location

of works, Railroad District, Elko County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of October, 1871, an assessment of (No. 3) of Ten Cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment remains unpaid on Monday, the 13th day of November, 1871, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, DAVID WILDER, Secretary, Office, No. 21 Merchants' Exchange, California street, San Francisco, Cal. oct4-4w

## Kearsarge Mining Company—Location

of works, Kearsarge District, Inyo County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 21st day of October, A. D. 1871, an assessment of five (\$5) dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room No. 10, Express Building, northeast corner of California and Montgomery streets, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday, the 27th day of November, A. D. 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 28th day of December, A. D. 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, J. S. L. KIRK, Secretary, Office, Room No. 10, Express Building, northeast corner of California and Montgomery streets, San Francisco, California. oct28-4w

## Kincaid Flat Mining Company—Location

of works, Tuolumne County, State of California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of October, 1871, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said company, payable immediately, in U. S. gold and silver coin, to the Secretary, at his office, No. 221 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 13th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, R. H. CORNELL, Secretary, Office, 220 Clay street, San Francisco, oct21-4w

## Nevada Land and Mining Company—Location

of works, Spruce Mountain, Antelope and Clifton Districts, Elko County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 12th day of October, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Saturday, the 10th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, WM. D. WATSON, Secretary, Office, Room 5, No. 302 Montgomery street, San Francisco, California. oct14-4w

## Noonday Silver Mining Company—Location

of works, White Pine Mining District, White Pine County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 10th day of October, 1871, an assessment of twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, JOSEPH MAGUIRE, Secretary, Office, Room 5, No. 302 Montgomery street, San Francisco, California. oct14-4w

## Pocahontas Gold Mining Company—Location

of works, Mud Springs, El Dorado County, California. Notice—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 18th day of September, 1871, the several amounts set opposite the names of the respective shareholders, as follows:  
Names. No. Certificate. No. Shares. Am't.  
L. A. Booth, Trustee } 49 100 \$300 00  
(for P. O. M. Co., )  
And in accordance with law, and an order of the Board of Trustees, made on the 18th day of September, 1871, so many shares of each parcel of said stock, as may be necessary, will be sold at public auction, at the office of the company, Room 26, Hayward's Building, 419 California street, San Francisco, California, on Monday, the 27th day of November, 1871, at the hour of 12 o'clock m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. D. A. JENNINGS, Secretary, Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal. nov4-4w

## KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE CHIEF MASTER MECHANIC, SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly, A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, OREGON, April 22, 1871.

Mrs. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best pump in use.

Yours respectfully, O. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 21st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly, C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

Messrs. KNOWLES & SIBLEY, 22 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly, GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 22 and 24 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully, WM. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDAUQUA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc., EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELLERTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.

Yours very respectfully, G. W. WHITAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly, P. SAULT, Superintendent.

OFFICE OF RED BLUFF WATER WORKS, Red Bluff, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

THE PATENT  
Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE,

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into this instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Hmhmhm," but call and investigate its merits. One can always be seen at the Pacific Iron Works. Ten of these Mills are now in operation. For further particulars address

## Longshore's Combination Tool.

This device is just what its name indicates. As a  
KITCHEN TOOL it is indispensable. It will fit and lift  
with perfect safety, any Stove Lid, Frying Pan, Pie Pan,  
Pot, Kettle, or any other vessel or dish used about a  
stove. It is a complete tool for stretching carpets,  
driving tacks, pulling tacks, &c., &c. It answers the  
double purpose of hammer and pincers, and is also a  
good Nut Cracker. It is made of the best malleable  
iron, and the Hammer, Pincers and tack puller, are all  
hardened so as to stand the roughest usage. An Agent  
is wanted in every town on the Pacific Coast to sell this  
valuable little implement. Retail prices fifty cents.

Howard st, between Fremont and Beale, San Francisco.  
2v21-tf

## THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

## IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

## LORD &amp; PETERS,

## Varney's Patent Amalgamator.

## These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they  
have no equal. No effort has been, or will be spared,  
to have them constructed in the most perfect manner,  
and of the great number now in operation, not one has  
ever required repairs. The constant and increasing de-  
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly  
into the pulp, or with steam bottoms, as desired.

## This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces  
the pulp to the center, where it is drawn down through  
the aperture and between the grinding surfaces.—  
Thence it is thrown to the periphery into the quicksilver.  
The curved plates again draw it to the center, where it  
passes down, and to the circumference as before. Thus  
it is constantly passing a regular flow between the grind-  
ing surfaces and into the quicksilver, until the ore is  
reduced to an impalpable powder, and the metal amal-  
gamated.

Settlers made on the same principle excel all others.  
They bring the pulp so constantly and perfectly in con-  
tact with quicksilver, that the particles are rapidly and  
completely absorbed.

Mill-men are invited to examine these pans and settlers  
for themselves, at the office, 229 Fremont Street,  
San Francisco.

## To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fee then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

### DEWEY & CO.,

United States and Foreign Patent Agents, publishers Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

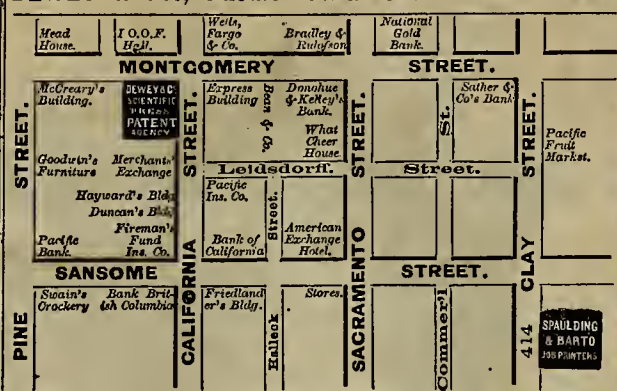

### Wanted.

We desire to make arrangements with a reliable man to act as general agent for Oregon and Washington Territories, to sell a new and saleable article. WIESTER & CO., 17 New Montgomery st., S. F.

OFFICE REMOVED,.....OCTOBER, 1871.

## DEWEY & CO., Pacific Rural and Scientific Press

Having Removed, Oct. 1, 1871, to more pleasantly and centrally located quarters, we shall be pleased to receive our friends and patrons at our new location, designated on this diagram.

PATENT AGENCY, 338 Montgomery St., 3d floor, S. E. cor. California, S. F.

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

### GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BLANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

20v22-3ml6p

BANDMANN, NEILSEN & CO.,  
General Agents, No. 210 Front Street.

## The California Powder Works

No. 314 CALIFORNIA STREET,  
SAN FRANCISCO.

Manufacturers and have constantly on hand

### SPORTING, MINING, And BLASTING POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

### Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

### HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

15v20-3m

JOHN F. LOHSE, Secretary.

### PHILLIPS' WEE PET

### Portable Assaying Apparatus

This invention is specially intended for prospectors and travelers. Further particulars concerning its use can be obtained at Mr. Phillips' assaying and instruction rooms, No. 423 Washington street, San Francisco. 18v23-4f

## OCCIDENTAL Insurance Company OF SAN FRANCISCO.

ash Capital, . . . . . \$300,000

GOLD COIN

OFFICE, 436 CALIFORNIA STREET.

Fire and Marine Insurance.

All Losses paid in U. S. Gold Coin.

A. G. STILES, President.

B. ROTHSCHILD, Secretary.

# SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,  
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 11, 1871.

VOLUME XXIII.  
Number 19.

## Academy of Sciences.

The regular semi-monthly meeting was held on Monday evening the 6 inst., President Blake in the chair.

### A New Polishing Material.

Professor Davidson presented a specimen obtained by A. W. Chase, of the Coast Survey, resembling in appearance French prepared chalk. The Professor said it was found in nodules varying in diameter from four or six inches to as many feet. It was the best substance for polishing that he had ever seen, leaving no scratch. It was found in extensive deposits.

### Rara Avis.

Mr. Harford exhibited a large white bird, which had been shot on the San Miguel Island while flying, and wanted to know its species.

Dr. Cooper said it was called at Fort Yuma the "Colorado Turkey." In fact it was the Wood Ibis. Several of the species had been shot near Stockton, but it was very scarce on this part of the coast.

### Indian Relics.

Mr. Harford also displayed several Indian curiosities dug by himself and W. G. Blunt, both of the Coast Survey, who are now studying the traces of the now extinct race of Indians formerly occupying the San Miguel, Santa Rosa and Santa Cruz islands. They were taken from Indian graves, or pits, one of which he mentioned as being about 25 feet in length. The curiosities consisted of heads, arrowheads, pipes, rude ornaments, paint, etc.

Prof. Davidson said the explorations had proved the islands to have been extensively populous. It was not improbable that centuries ago a Japanese or Chinese junk may have been wrecked and the crew drifted to one of these islands and mixed with the natives.

### Diamond Deposit.

Mr. Hanks presented samples of the diamond deposit of South Africa, brought from thence by J. H. Riley—one of the first layer, which has to be pierced to get to the diamond deposit; another of the deposit in which the diamonds are found, and another of pebbles found associated with the diamond. The last, it was remarked bore great similarity to the pebbles found at the north of the Klamath river, where microscopic diamond dust was found; also on the Pescadero.

### Apple Pests.

Dr. Gihbons exhibited several half-grown apples, which bore many insects attached to the rind, affecting the growth of the apple by causing indentations where they appeared. They would not usually be observed by a person eating the apple; and thus might be introduced into the stomach in large numbers.

Dr. Cooper drew on the blackboard the sketch of a fish, a connecting link between a fish and reptile, of a species now extinct. It was as represented by Agassiz from a single tooth, found on this coast and sent East.

Professor Davidson said the recent developments made by the aid of telegraphic communication proved that San Francisco was four minutes further west from Greenwich than had heretofore been supposed—the old calculation being 8 hours 9 minutes 34.19 seconds, and the present being 8 hours 9 minutes and 33.13 seconds.

## A Remarkable Explosion in the Sun.

Prof. C. A. Young, of Dartmouth College, an astronomer of considerable note, who has been making some careful investigations with regard to the physical condition of the sun, recently witnessed an outburst of solar energy, most remarkable for its suddenness and violence, and one which shows us what can be done in the way of explosions when all the conditions are on a scale of grandeur commensurate

Fig. I.

with the magnitude and anomalous physical condition of our solar luminary.

The professor employs in his examination, an instrument lately introduced and known as the telespectroscope,—a combination of the two instruments, whose names are embodied in that word.

On the 6th of September last, about noon, while the professor was viewing the sun, he observed an enormous protuberance or hydrogen cloud, of the ordinary

Fig. II.

brightness of sun clouds, on the eastern limb of the sun, which was singular in nothing but its extraordinary size. This cloud remained without any noticeable change until about the same hour the next day, when a brilliant bright lump began to develop itself, shaped much like an ordinary summer thunder-head near the horizon, in the earth's atmosphere.

The appearance of this cloud and the "thunder-head" development is shown in Figure 1. The main cloud appears to much resemble a huge overhanging cloud in our tropical seas, as it is sometimes observed with two or more water spouts connecting it with the ocean. These ap-

pearances are not uncommon to the sun's upper atmosphere, and have sometimes been compared to a banyan grove. The length of this cloud, as was ascertained by measurement at the time, was about 100,000 miles, by some 54,000 miles in height. The heights of the filaments or columns, which appeared to support the cloud, were about 15,000 miles. Such was the appearance presented when the Professor was called away from his instrument about noon the 7th of September. What he witnessed on his return we give nearly in the Professor's own words, as communicated to the *Boston Journal of Chemistry*, from which paper we have also reproduced the accompanying illustrations:—

What was my surprise, then, on returning in less than half an hour, to find that in the mean time the whole thing had been literally blown to shreds by some inconceivable up-rush from beneath. In place of the quiet cloud I had left, the air, if I may use the expression, was filled with flying debris—a mass of detached vertical fusiform filaments, each from 4,500 to 13,500 miles long by 900 to 1,400 miles wide, brighter and closer together where the pillars had formerly stood, and rapidly

Fig. III.

ascending. When I first looked, some of them had already reached a height of nearly 100,000 miles, and while I watched them they rose with a motion almost perceptible to the eye, until in ten minutes the uppermost were more than 200,000 miles above the solar surface! This was ascertained by careful measurement; the mean of three closely accordant deter-

Fig. IV.

minations gave 211,050 miles as the extreme altitude attained, and I am particular in the statement because, so far as I know, chromospheric matter (red-hydrogen in this case) has never before been observed at an altitude exceeding 135,000 miles. The velocity of ascent also, 166 miles per second, is considerably greater than anything hitherto recorded. A general idea of its appearance when the filaments attained their greatest elevation may be obtained from Figure 2.

As the filaments rose they gradually faded away like a dissolving cloud, and in twenty minutes from my return, or at 1.15 P. M. only a few filmy wisps, with some brighter streamers low down near the chromosphere, remained to mark the place.

But in the meanwhile the little "thunder head," before alluded to, had grown and developed wonderfully, into a mass of

rolling and ever changing flame, to speak according to appearances. First, it was crowded down, as it were, along the solar surface; later, it rose almost pyramidally 50,000 miles in height; then its summit was drawn out into long filaments and threads which were most curiously rolled backwards and downwards, like the volutes of an Ionic capital; and finally it faded away, and by 2.30 had vanished like the other. Figures 3 and 4 show it in its full development; the former having been sketched at 1.40, and the latter at 1.55.

The whole phenomenon suggested most forcibly the idea of an explosion under the great prominence, acting mainly upwards, but also in all directions outwards, and then after an interval followed by corresponding in-rush: and it seems far from impossible that the mysterious coronal streamers, if they turn out to be truly solar, as now seems likely, may find their origin and explanation in such events.

The same afternoon a portion of the chromosphere on the opposite (western) limb of the sun was for several hours in a state of unusual brilliance and excitement, and showed in the spectrum more than 120 bright lines whose position was determined and catalogued—all that I had ever seen before, and some 15 or 20 besides.

Whether the fine Aurora Borealis which succeeded in the evening was really the earth's response to this magnificent outburst of the sun is perhaps uncertain, but the coincidence is at least suggestive, and may easily become something more if, as I somewhat confidently expect to learn, the Greenwich magnetic record indicates a disturbance precisely simultaneous with the solar explosion.

The paper of Prof. Young will be read with deep interest by every one, and we need offer no excuse for the space which we have devoted to it. The *Journal of Chemistry* says of it:

It is certainly an important contribution to our knowledge of solar physics, and will add to the author's reputation as being one of the most vigilant and competent observers living. No statement could afford a clearer idea of the stupendous energies and intense activities prevailing on the sun than that of Prof. Young, and the phenomenon must have a near or remote bearing, not only upon our planet, but upon the whole family of bodies which are held in place by the sun's attraction.

The change in the spectrum after the "in-rush" of luminous matter which followed the explosion, is a most interesting and important point, inasmuch as it would seem to show that new elements or forms of matter were brought to the surface by the disturbance. Prof. Young observes that during the unusual brilliance and excitement of the solar surface, on the afternoon of the 7th of September, fifteen or twenty new lines were observed in the spectrum.

Explosions of this kind are probably not unfrequent, and it is singular that no one has yet been brought directly under telescopic observation. The thirty minutes absence of Prof. Young from his instrument happened to be a most important period of time, and no one can regret the circumstance more than himself. Our interest in solar spectroscopy increases every year, and we have reason to expect that the enlargement of the boundaries of knowledge in that direction will be rapid and wonderful.

THE LABOR EXCHANGE.—During the last month 1,228 persons—viz: 682 men and 546 women—have been ordered from the Exchange, and employment has been furnished to 741 persons—viz: 440 men and 301 women.

## MECHANICAL PROGRESS.

## Phosphor-Bronze.

A number of experiments have recently been made in Europe, on an alloy of copper and tin containing phosphorous, to ascertain its hardness and tenacity in comparison with cast-steel. A recent number of the *Houghton (Lake Superior) Mining Gazette* contains quite a long article on the subject of these tests and the approval which the alloy is said to have obtained on the part of those who have used it.

They think that the general adoption of the alloy, in place of other metals, for ordnance and for certain other purposes for which cast-steel or even cast-iron is employed, would be highly advantageous to the parties using it, and also to the copper mines of Lake Superior.

The new alloy can, they say, be made as tough as wrought-iron; its hardness, on the other hand, may be regulated to equal that of steel; its electricity is great and holds out undiminished until rupture; its fluidity is such that the 20-inch gun and the clock-wheel may be cast with equal soundness, accuracy and perfection; its homogeneity is complete, its grain as fine as that of cast-steel.

According to a table showing the tenacity of various varieties of the new alloy, one specimen broke with a strain of 52,625 pounds to the square inch of section, while another showed an elastic resistance of 24,700 pounds to the inch.

They say that according to advice from Dr. Kunzel, dated April 26, 1871, the Prussian Government "has definitely and in principle adopted the phosphor-bronze for the field artillery of the entire German Empire;" but they are, we think, misinformed. The statement that cannon made of phosphor-bronze "will withstand the highest test to which the celebrated Krupp steel guns are subjected" is not, we believe, confirmed by the latest reports in the *Augsburger Zeitung*, which recently commented on the competitive trials.

We are informed, also, that in order to test the adaptability of phosphor-bronze to such parts of machinery as are subjected to violent and sudden shocks, the cog-wheels of Meers, Gilliaux & Co.'s heaviest iron rolling mill, which had hitherto been made of best cast-iron, and which broke down at least once a week, were replaced by phosphor-bronze gearing (weight about 8 cwt.), which has now been in continual use for more than ten months, and is yet in perfect condition.

If this is so, and there seems to be no good reason to doubt the truth of the *Gazette's* statement, a wide field is open for phosphor-bronze, and we sincerely hope that it will so increase the demand for copper as to render possible the profitable working of many of our good copper mines which are now lying idle.—*Engineer and Mining Journal*.

## Finishing Steel.

Of all the methods or processes of working and finishing of steel, probably there is none extensively used about which so little is known by mechanics in general as that of the "friction wheel," and this lack of knowledge has no doubt kept its use confined within the bonds of almost a single class of work. It is generally known that the smooth edge of a soft steel or iron wheel, when run at a high speed, will cut tempered steel, soft steel, iron, and other substances very rapidly, but with it goes the belief that steel so cut is practically ruined for all useful purposes. This is true only to a certain extent, and is entirely avoidable by a proper speed of the friction wheel and a skillful operator. A smooth steel wheel running with a periphery speed of two to three miles per minute, will cut steel at a rapid rate, and without heating it to such an extent as to even change the color, the cutting wheel, too, retaining its form for a great length of time without being re-turned. Not only the spiral sides of augers and auger bits are smoothed out and finished by friction wheels, but the fine screw points of the same are wholly formed by the sharp edge of a soft steel plate run at the frightful speed of 14,000 revolutions a minute. The freedom from heating or burning the work, as well as the accuracy and beauty with which it is done, is unquestionably in a great measure due to the skill of the operator; still this skill may be matched by the skill of the inventors, and the friction wheel applied to hundreds of purposes yet unthought of.

## Seasoning Timber by Steam.

All seem to agree that timber or lumber dried by steam is not so good as weather-seasoned stuff. The loss is in elasticity and strength, and consequently, also, in durability. But steam-dried wood does not absorb any more moisture than weather-dried; in either case, the absorption is from five to ten per cent. All bending should be done just as it comes from the steam-box, while the wood is yet in a hot damp state, and *never after*. Indeed, all wood intended for heading purposes should never be allowed to dry before bending. No cooper will buy dry hoop-holes, because they have lost their elasticity and toughness. It is true we have once seen dry veneers put on circular lintels, but the glue alone held them in position, and we pitied the owner of the house. Only one question remains unanswered, to wit: "Is steam-dried timber more apt to warp than air dried?" We answer, no; it is less, and this, in addition to the time gained, appears to us of such importance that we think the whole subject worthy of more consideration than we are now prepared to give it. Meanwhile, we advise not to hire steam for drying lumber before one is fully posted on the process. Green timber, in order to be dried thoroughly by steam, should be treated, first, for at least twenty-four hours, by free steam, and then from eight to twelve days by dry or superheated steam. A single steam-hath in a box will most certainly not effect a thorough drying, or make the wood even approximately, like weather-seasoned material. Quick drying of wood is an art hitherto little attended to by chemists, although it is an interesting and profitable field. Notwithstanding the general assertion that artificial processes damage lumber, we are among those who believe the day not far distant when wood will be dried artificially, without deterioration, for many mechanical purposes.—*The Hub*.

**XYLONITE.**—Xylonite is a substance of which the chief ingredient is chemically allied to gun-cotton, being formed by the nitric acid upon woody fibre. One of the chief uses to which it is applied is for making impermeable sheeting; and if all that is said about it bears the test of experience, it bids fair to take the place of india-rubber. Different samples of waterproof fabrics vary in substance from a thin transparent tissue up to a thick, strong cloth suitable for water-beds, water-cushions and other articles where strength of fabric is all important. Xylonite has several advantages over india rubber. It is not affected by a boiling temperature, and can be readily washed in soap and water and ironed like ordinary linen or cotton fabrics. It is not acted upon by oil or grease. Xylonite materials can be made of any color, are considerably cheaper than similar gutta-percha or india rubber fabrics, can be used again and again, and can be kept in store for any length of time without deterioration.—*London Lancet*.

**BLASTING TIMBER WITH DYNAMITE.**—Some extensive experiments have recently been made in the Forest of Haye, on the use of dynamite in blasting timber, which is found to be far more effective than ordinary powder. The dynamite was applied to some large stumps sawed from trees which had been uprooted in a storm and become thoroughly seasoned. A ¾-inch hole was bored down the center of the stump 9 to 15 inches deep, which was charged with a dynamite cartridge of 50 grms. The discharge would divide the tough root into quarters, and so otherwise shatter it that it could be easily broken up by the workmen. In this way profitable results were obtained from timber, which would otherwise have been abandoned.

**SURFACE BLOW FOR STEAM BOILERS.**—A new attachment to steam boilers has been invented, whereby the light scum on the surface of the water can be blown off. An inverted cup is suspended, by means of a vertical pipe, from the top of the boiler, so that its lower edge will be a few inches above the water line. A suitable cock is fitted into the pipe. To blow off the surface of the water, the pipe is opened, when the steam under the cup will escape, relieving thereby the water directly beneath from pressure, and causing the same to ascend and follow the steam through the pipe. The light surface scum will thus be entirely ejected, as it flows under the cup to fill the space formerly occupied by the escaped water, and is there also drawn up by the suction.

## SCIENTIFIC PROGRESS.

## Ice Fleas.

Dr. Franklin, while recently rambling among some of the Alpine glaciers turned over some small, isolated stones, under which he observed numerous small, black insects, much resembling the common flea, and, like that insect, jumping many times its own length at a single spring. The insects were not found under every stone; but a little observation showed the conditions under which they were found, which the doctor described as follows, in *Nature*: They generally occurred under flatish fragments of rock, presenting a surface of about a square foot, and having a thickness of from 2 to 4 inches. Stones of this size are sufficiently warmed by the sun's rays to melt the ice beneath them more rapidly than it is liquefied by the direct solar beams. A surface of rock absorbs luminous thermal rays better than does a surface of comparatively white ice, and it transmits these rays to the ice beneath it, partly by conduction and partly by radiation from its under surface. The stone thus melts its way an inch or two deep into the ice, forming for itself a kind of basin. Sometimes these cavities are water-tight, and then any space between the stone and the wells of its basin is filled with water derived from the melting ice. Under such conditions I never found any fleas beneath the stone. But occasionally the ice basin is drained, and it was under stones resting in such comparatively dry basins that the insects were found. In all cases, nearly the whole of the fleas were found upon the ice, very few being attached to the stones. They were grouped together in shoals, so that probably 40 or 50 of them frequently rested upon a single square inch of ice. On removing the stones, the insects were very lively, owing probably to their sudden transition from comparative darkness to direct sunlight.

I saw no indications of food of any kind beneath the stones, but we have not to search far for a possible source of food. The cold of the glacier benumbs and kills thousands of insects which alight upon its surface, and bees, wasps, flies, and moths are frequently seen dead upon the ice. Then there is the so-called "red snow," and other allied organisms of similar habits, which may perhaps minister to the wants of this singular insect. Is the ice flea, like its irritating cousin, a nocturnal predatory insect, and does it issue from its abode at nightfall in search of frozen bees and butterflies?

**FREEZING OF WATER UNDER PRESSURE.**—M. Boussingault, after briefly referring to the experiments of the Florentine Academicians, and of Huyghens (1667), on the force exerted by the freezing of water in closed metallic vessels, relates a series of experiments made by him last winter in order to ascertain whether water, when put into a strong vessel (a steel cylinder of great strength, and so arranged that the dilatation, or expansion of the water, when cooled below 39° F., could be prevented), would or would not remain liquid, even when exposed to a cold very considerably below its point of congelation, in consequence of the expansion due to the cooling down from below 39° F., being prevented by the strength of the vessel containing the water and stopper (steel plug), fitted thereto. The result of this investigation was found to be that water remains liquid under the conditions alluded to, even at a temperature of zero, Fahr., but freezes instantaneously as soon as the impediment, caused by the resistance of the plug which hermetically closes the steel vessel, is removed, and free play given to the expansion of liquid. It should be noted that the sides and bottom of the steel vessel alluded to were of such strength as to be practically unyielding.—*Acad. of Science*.

**PHOSPHORESCENCE AND FAT.**—M. Panceri, in a paper presented to a scientific association, at Turin, claims to have established that the phosphorescent substance in fishes, in whatever part of the body it may be situated, is also fat, and that the phenomenon is due to its slow oxidation in contact with air. The skin of fishes is permeable to gases, and the oxidation of the subcutaneous fat proceeds without difficulty. Phosphorescence shows itself, as a rule, some time after death, and continues until putrefaction sets in; accompanied by the disengagement of ammonia, phosphorescence ceases. Phosphorescence is prevented by the presence of fresh water, alcohol, or carbonic acid; oxygen, on the other hand strengthens the phenomenon.

**ABSORBENT POWERS OF CHARCOAL.**—Dr. Hermann Vohl, of Cologne, has lately published an elaborate paper in the *Archiv der Pharmacie*, upon the absorbent power of charcoal and its application for disinfectant and deodorizing purposes, replete with suggestions of great importance.

Among other deductions from his experiments, he states that the carbonic acid gas obtained by heating charcoal is not derived from the coal itself, but has been absorbed from the atmosphere, and is held with such tenacity that it can not be driven out by boiling in water, but that a temperature much below that of ignition is sufficient to expel it. This conclusion is the same as that which had been reached by another experimenter, to which we have previously made reference. Among other facts proving this statement, Dr. Vohl remarks that when charcoal has been once freed from its carbonic acid and saturated with pure oxygen, no trace of carbonic acid is appreciable, even when heated to a temperature of 680° Fahr.

**THE BAROMETER AND THE SEA LEVEL.**—Dr. Carpenter in a late communication to *Nature*, calls attention to the neglect, in the late discussions upon the ocean currents, of published observations made upon the influence of variations of barometric pressure upon the sea level. In this connection he remarks that, according to one author, a fall of one inch in the barometer is pretty uniformly accompanied by a rise in the sea level to about thirteen times this amount, or thirteen inches; and another makes the ratio to be about one to thirteen and a half inches, this being subsequently corrected by about twelve and three-fourths inches. Dr. Carpenter thinks that this relationship of barometric pressure to the height of the tides may serve to explain a number of anomalous phenomena that have perplexed observers, especially with reference to unusual rises of tides, and their retention at high level longer than customary.

**DECIDUOUS NATURE OF THE RHINOCEROS'S HORN.**—The statement that the horn of the rhinoceros is deciduous, or, at least, can be reproduced when accidentally lost, has been confirmed lately at the Zoological Gardens in London. One of the animals, a male Indian rhinoceros, had been in the habit of trying to raise a transversal bar keeping him off from the pen of the female, and this was attempted at one time with so great violence as to tear the horn entirely off. Considerable loss of blood ensued, which, however, was soon stopped and the surface healed. Soon after indications were observed of the formation of a new horn, which, at the date of the account, had already attained a height of one and a half inches. The old horn was about twelve inches high, and its base eight and a half inches in the long diameter and five and a half across.

**MR. CHARLES DION, of New York, proposes to place on apparatus on steamers and other vessels, so arranged as to sound an alarm on approaching the vicinity of an iceberg. The device is arranged on the bottom of the vessel, and is of such a nature that when the keel strikes any very cold strata of water the alarm is sounded. It is well known that icebergs refrigerate the water around them for a considerable distance. Mr. Dion's instrument will exhibit the exact temperature of the water below the vessel at all times.**

**DANGERS OF CHROMIC ACID.**—M. Gubler, remarks that chromic acid is one of the most powerful of caustics. Only the monohydrous sulphuric acid at all approaches it in strength. It acts rapidly, setting free a considerable amount of heat, so that the temperature may rise 125 or 150 degrees. If we plunge a small animal, such as a mouse, into a concentrated solution of chromic acid, it is instantly reduced to a cinder; and the ebullition is so great that unless care be taken, the mouse and a part of the solution are forcibly ejected.

**GUN POWDER.**—When gun powder is ignited and the resulting gas cooled down to the ordinary temperature of the atmosphere, it is found to occupy only 900 times the space of the powder. But when it is ignited in ordinary projectiles, so that the gas generated is at a high, red heat, the gases will occupy 2,500 times the space of the solid powder. Thus we see whence is derived the enormous force of powder, when ignited in a place of close confinement, where the gases may be elevated to their practical temperature.

## CORRESPONDENCE.

### Actions of Oxychloride of Copper on Argentite.

EDS. PRESS:—In relation to your articles on the chemistry of the Washoe pan process, I wish to state that I think Bowring is correct in saying that oxychloride of copper reduces argentite to metallic silver, as I have made the experiment and found it so. It is proper to mention, that in my experiment, metallic copper was present, but the silver was not precipitated on the copper, but formed a coating on the argentite. By addition of mercury and occasional warming, reduction was pretty complete in 12 hours.

At the same time I think the author named is wrong in denying the formation of silver chloride in the patio; but almost all the writers on that subject seem to speak as though sulphide of silver was the only mineral to be considered, whereas, many other compounds will yield to the action of copper chlorides.

Partzite, for instance, yields silver chlorides, and Kroenke is working an antimonial (red) ore with dichloride of copper, which converts the silver to chloride. C. H. A.

### On the Loss of Quicksilver.

EDITORS PRESS:—The letter of your correspondent, F. M. S., in your issue of Oct. 14th, explains the difficulty which seems to exist, in getting up a friendly discussion of any matter pertaining to metallurgy. Our mining and milling "experts" hoard their "titbits of experience" in the fond delusion that they are the only possessors of some great secret, when the fact is, that, nine times out of ten, the thing is known to hundreds, and practiced by those who think it worth while.

When I was at a metallurgical establishment in San Francisco, a man walked in and asked if we wanted to employ "a scientific man." As he was dressed like, and seemed to be, a laborer, I made some enquiry as to the basis of his pretensions, and found that his scientific attainments consisted in a discovery that, in certain conditions of the quicksilver in pan working, the addition of a little of the "red powder" resulting from boiling solution of blue vitriol with nails (cement copper) would assist the settling. That I think, is a fair sample of a majority of the "titbits of experience," the owners of which forget that hundreds of others have also their titbits, and that a generous system of exchange would benefit all, since he who relinquished the monopoly of one, would receive the benefit of several others in return; moreover, the general advancement of metallurgical skill must redound to the benefit of all concerned.

The question which led to all this so far profitless talk, emanated from myself, and I may therefore be permitted to say, that its answer does not necessarily involve the betrayal of any trade secret.

My object in raising a discussion on the subject in question was, to elucidate the causes of the loss, as a first step towards the consideration of the remedies.

It may be presumed that, in each mill, running steadily on a certain kind (not quality) of ore, the mechanical loss will be nearly in a constant ratio to the quantity of quicksilver in use, which quantity will vary with the quality, by which I mean richness of the ore. The question then is, leaving out of consideration the percentage of mechanical loss, which will differ in different mills, how much more is lost in working a ton of ore containing \$500 than in working a ton of the same kind of ore containing \$50?

This is the first of three questions to which it is desirable to have answers. What bearing has the richness of a given kind of ore on the loss of quicksilver sustained in working it by any given process.

The second question is, what is the relative effect of different kinds of ore, of similar richness, on the loss in working by any given process. The third question is, what is the loss in working similar kinds of ore of similar richness, by different processes.

When these questions are satisfactorily

answered, which can only be done by comparing notes or by an elaborate system of experiments, the first step will have been taken toward a very important saving in metallurgy.

In the foregoing, I refer only to the chemical loss of mercury, or that action of the minerals in the ore, or of the chemical treatment used, by which a portion of the metal is converted into something else, some compound, as calomel, or oxide.

As I opened this ball, it is perhaps proper that I should lead off in the dance, and as I am not at present ready to say much in regard to the chemical loss, I will give my views on that which, though doubtless effected by the chemical conditions, is in itself essentially mechanical. Perhaps it would be better made the subject of another communication. C. H. A.

### BATTLE MOUNTAIN, NEV.

BY OUR OWN TRAVELER.

EDS. PRESS:—A short distance from Battle Mountain city, which is seven miles from the railroad, is

Galena City,

a small burg with two hotels, a few business houses, etc. I visited a few of the most prominent mines in the vicinity of this place, the first of which was

The White,

owned by Knowles & Earl, of your city. We went down the shaft 146 feet, and then into one of the four drifts. There are 18 men employed. In the drift north of the shaft, 110 feet, the lode is almost perpendicular—dipping slightly to the east, and averages one foot in width. Upwards of 3,000 tons of ore are said to be in sight, the first-class of which yields 30 per cent. lead and \$275 per ton in silver; second class about \$35. The ore is sold to smelters in San Francisco, about 40 tons of first class being shipped monthly. South of this lode, 1,800 feet, is

The Shiloh Mine,

an extension of the same, and belonging to the same owners. The ore yields about 50 per cent. of lead, and \$100 per ton in silver. Three levels have been run from a shaft 104 feet deep, showing heavy bodies of ore. The hoisting works and pumping apparatus on this mine are very complete, and the whole property a very desirable one.

The Avalanches

has a shaft 70 feet deep on a lode 2½ feet thick. It is owned by Dunn & Bro. The ore averages 60 per cent in lead, and \$119 per ton in silver.

The Avalanche North

has a shaft 35 feet on a lead the ore of which goes \$118 per ton in silver and yields 40 per cent. of lead.

Nevada Butte Co.

The mill belonging to this company was built but a short time since, and has 15 stamps weighing 750 pounds each. The building is 70x90 feet. The engine was built at the well-known Vulcan Iron Works in San Francisco; there are two large boilers. The coal used costs \$18.50 per ton, delivered at the mill. There are six pans and an equal number of settlers. Wm. Garrard is superintendent of the mill and mine.

The Trinity

belongs to this company, and is considered one of the best mines in this section. The shaft is 140 feet deep, and a drift run 100 feet south at a depth of 50 feet. The base metal ore yields largely, and many tons have been shipped to your city for reduction. Another very promising mine belonging to this company is

The Butte,

and they are contemplating the erection of a large furnace for reducing the ore. The whole property is a valuable one.

The Battle Mountain Co.

have bought some copper mines and have 24 men employed in working them. The main shaft is down 113 feet, a drift run about the same distance, and several shafts sunk from it, one 36 feet deep. Ore has been taken out from chambers 4x30. The mine bids fair to be a very valuable one to the owners—an English company. The ore is shipped to England via San Francisco. The price for shipping is as follows: from mine to railroad \$7.50; from there to San Francisco, \$11; to Liverpool, from \$6 to \$7 per ton. The ore averages about 24

per cent. of copper. Mr. Jos. Richards is general manager.

Trenton Mine.

This ledge is located on the western slope of Battle Mountain. The main shaft is down 293 feet, one tunnel has been run in 300, and another 250 feet. The lode is about 12 inches wide. Wood and water are abundant. The ore averages \$90 per ton. At Battle Mountain station I notice that some works have been erected for the reduction of antimony, within the past year. W. H. M.

### EFFECTS OF CLIMATE ON FRUITS.

EDS. PRESS:—It is well known to horticulturists that trees and plants from a wet, or even a moist air and climate, do not prosper so well in a country and soil that is too dry and arid in its character, and that vegetation which flourishes well in countries of sandy or dry soils will, in a measure, if not equally, deteriorate in a too humid atmosphere and locality. As superabundance of moisture will cause some of our most valued cultivated fruit trees to be unduly watery, or possess soft wood or stems, and so become in a manner diseased, and of a dropsical habit, and so run inordinately into wood instead of fruit, their produce will be apt to fall before it is matured, and that which is retained will be, in its juice, watery and void of good flavor. But on the contrary condition of the case—that is, where there is not enough rain, or moisture from irrigation, if the size of fruits is not much arrested their fine qualities and rich flavor cannot possibly be obtained or brought out.

Our own California, for instance—especially in the last two seasons, which have lacked sufficiently seasonable rainfalls, (having last year rather unusual heat), and when irrigation had to be resorted to in an uncommon degree, it has been seen that, although remarkable size and beauty has been obtained in the more succulent fruits, yet the desired high flavor has, in the first of the two years at any rate, been found to be more than commonly lost; whereas under circumstances more favorable to their development these same fruits would have possessed far better qualities.

Luckily for us, in our almost exceptionally splendid climate, heavy rains rarely occur at the time of the blossoming, to arrest the healthy results of the pollen on the stigmas. If anything, we have generally rather too much light and sunshine and dry heat, though these are essential to stimulate our most valuable plants. We must not go, however, into the contrary extreme and plant our fruit-bearing trees, especially the grape, in low, wet and excessively rich grounds, or upon that kind of land which has an underlay of hardpan soil, unless indeed it can be subsoiled or trenched. Wet situations can, of course, be underdrained, but in that case the extra great expense must be taken into account.

We certainly approach fortunately, pretty closely in California to that mean temperature for the year, which, although not exactly settled by botanists, is so desirable, not varying many degrees. We certainly cannot be said generally in the State to suffer much from frost, but the heat and dryness is mostly much in excess. This is what we have to judiciously regulate in a considerable degree by artificial means—at least the dryness—by systematic, or particular local irrigation. Our hardy fruit trees can scarcely be said to have to hibernate during winter. We have no disastrous effects from frost which they have in so many parts of the United States and other countries.

The time is approaching when in many parts of this region the application of special manures to fruit trees and plants, will be necessary, as Liebig has wisely suggested, that the ashes of the plant will show exactly what it needs, and an analysis of soils will inform us whether they contain all the necessary elements, and in the right proportion.

Light is a great stimulant in the growth and health of vegetation. Of this we have rather a superabundance. In our powerful sun, preserving lower branches need hardly be recommended, for, it is evident it is well practiced, although it is not so needful for the stems of the trees here, as in climates where there is much frost, and also, in the summer, a hot sun.

E. J. HOOPER.

San Francisco, Oct. 30th, 1871.

### Mines in Inyo County.

EDS. PRESS:—I notice in your valuable paper letters from different mining districts throughout the country, and as they are always read with interest by me, I presume a few notes from this section might also be of interest to persons in other parts. The most important mine in my estimation, and among the first located in Owen's River valley, is

The Eclipse.

The predecessors of the present company had a 10-stamp mill; but owing to the Indian difficulties at the time, little ore was crushed, and it burned down without effecting much. The present company is an English one, having its principal office in London. The same board of directors managing this company, also manage several paying mines in Brazil, one of them, the Don Pedro, having paid to its shareholders, in dividends, the sum of £200,000. With such men as these at the head of the Eclipse, it will most certainly be a profitable investment. The new 30-stamp mill is driven by four of Linn's turbines, the water being conveyed from Owen's River by a ditch 5 miles long, 3 feet deep, and 9 feet wide, at bottom. The water being low this year, only 20 stamps can be used. The ore is conveyed to the mill by a railway 2¼ miles in length. The average width of the ledge is seven feet. Mr. H. Tregellas, the superintendent, is putting up some smelting furnaces for the galena ores, which assay from \$150 up to \$4,500 per ton.

The Kearsage,

I am sorry to say, has been compelled to suspend operations on account of a scarcity of water. Their usual supply has been received from the melting snows of the Sierra Nevada mountains.

The Union

is laying idle waiting developments on the Eclipse and the result of its first run in the new mill. The Owen's River Smelting Works will start up very shortly, the superintendent having just returned.

F. M.

Independence, Inyo Co., Oct. 25, 1871.

### Summer in Our Inland Valleys.

Mr. Wright, who furnished the valuable paper on the rains and climate of San Joaquin Valley which we published last week, also forwards us the following interesting notes with regard to the climate of our inland valleys generally:—When a stranger to the climate of Sacramento and San Joaquin valleys observes that as high a temperature as 110° in the shade is sometimes reached in our warmest weather, he is likely to draw the wrong inference that our summer heat must be very oppressive. But strange to say, it is rarely sultry here, and our hottest weather is never prostrating.

Sun strokes are of very rare occurrence. One may be exposed day after day in July and August without any protection from the sun's rays, and will not suffer, so long as he has all the cool water he can drink, and of that we have the greatest abundance. A delightful sea-breeze from the north-west prevails, with remarkable regularity in summer, from ten or eleven o'clock till late in the evening, and is constantly fanning us and furnishing the purest of air. Summer nights are cool with very rare exceptions, and always without dew. Usually one needs a blanket or two to sleep comfortably.

While our summer heat is prevented by these means from being prostrating, fall, and most of winter and spring, are as pleasant as the finest spring and autumn weather in the Eastern and Southern States. We speak here only with reference to the climate of our great inland valleys. Our coast and mountain climates are more uniformly cool and moist, while in the foothills the summer air is hotter and more oppressive, because the sun's rays fall more perpendicularly on a large part of the surface there, and its atmosphere is not so regularly ventilated by refreshing breezes as our open plains and the loftier portions of our mountain ranges. As a result of the difference, windmills for watering and irrigating purposes, are a specialty in our plains, but cannot be used to advantage in the foothills.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**MONITOR MINER.**—Oct. 28th: A ditch to carry water for use in the Schenectady mill has been surveyed this week.

**HAULING ORE.**—Silver Mt. *Chronicle*, Oct. 28th: This week, ore is being hauled from the Exchequer mine to the Co.'s mill.

### BUTTE COUNTY.

**RIVER MINING.**—Butte *Record*, Nov. 4th: The river mining the present season does not appear to have been so successful as usual.

**RICH ROCK.**—We were visited on Monday by S. N. Elton, the discoverer of the silver ledge in the Gravel Range Dist., near the dividing line of Butte and Plumas counties. The ledge shows a width on the surface of some 14 inches, and has widened to about 20 at a depth of 8 ft., the rock increasing in richness. The ledge crops out on the surface for a distance of 2,000 or 3,000 ft. Some of the rock taken out at a depth of 8 ft. exhibits remarkable richness.

### CALAVERAS COUNTY.

**LARGE YIELD.**—Calaveras *Chronicle*, Nov. 4th: Developments recently made at the Gwin mine, Lower Rich Gulch, are unparalleled in the history of quartz operations in this State. A strata of rock has been discovered in the main shaft at the depth of 400 ft., that for richness eclipses anything of which we have ever heard of. The rock closely resembles the slate of which the walls of the lead are composed. The strata mentioned lies next to the foot wall and is about a foot in width and thickness. In color and formation it so nearly resembles slate that it requires a close examination to distinguish the two from each other. The inclination of the "streak" differs slightly from that of the shaft. Commencing at a point near the surface it crosses the latter, diagonally, leaving the shaft at the 400-ft. level. By "drifting" a short distance on the lead, however, from the 500-ft. level, the strata will undoubtedly be struck again. By the merest accident it was discovered that this singular deposit, instead of being slate, was simply a mass of sulphurets, carrying free gold in abundance; 2½ oz. yielded 166 grains of gold! or, at the rate of \$53,140 per ton! The rock assayed was not selected. It was broken from a chunk at least a foot square and is considered a fair test of the richness of the whole strata.

**MOSQUITO GULCH.**—From the San Bruno mine, 27 tons of rock, crushed, yielded \$2,000—an average of \$74 per ton.

**CAMPO SECO.**—An assay of sulphurets from the Sailor claim, at a depth of 100 ft., showed \$48 per ton. An assay made last week, of some rock taken out at a depth of 20 ft., on a lode that runs through the south end of the town, from 3 different places, showed \$75 per ton. Spencer G. M. Co. are now at a depth of 60 ft., the rock constantly improving as they go down.

**COPPER ORE.**—Stockton *Republican*, Nov. 3d: Work has been resumed on the Union Copper Mine at Copperopolis, and ore is coming down from the mine. It is shipped in hags of 100 lbs each; 350 are now lying on the wharf.

### EL DORADO COUNTY.

**PLACERVILLE** *Republican*, Nov. 2d: Shepard & Witten have been tunneling to reach a gravel lead, and last week struck through into gravel cement that will pay fairly.

The mining interest about El Dorado is flattering. There is a good deal of prospecting, with fair results, and many of the old mines are being put in shape to work to advantage as soon as a supply of water can be had. The Pocahontas has started up again, employing 20 men; the mill is undergoing repairs and soon will start up.

### FRESNO COUNTY.

**SPECIMENS.**—Millerton *Expositor* Nov. 1st: We have been shown several very fine specimens of quartz obtained in the vicinity of Coarse Gold Gulch, and from other portions of the county. Some were float quartz, but others were from small but well defined gold-bearing ledges.

### INYO COUNTY.

**THE OUTLOOK.**—Inyo *Independent*, Oct. 28th: In Cerro Gordo, all the principal silver mines—the Belmont, Wittekind, San Lucas, Crowning Glory, Friendship, Buena Suerte and others—are working full forces, extracting large quantities of good ore. Plenty of lead is coming out of the galena mines situated directly in that

camp, the Union yielding the greatest quantities at present. The O. L. S. L. Co. have again put a heavy force on the front, which is being worked to a very great advantage through their deep, 900 ft. tunnel, while Belshaw and Beaudry employ a large number of miners. The Swansea works resumed active operations last week. The reduction works of the Eclipse Co. are now beginning to operate; 20 stamps of the battery of their new water-power mill are in motion.

**FLUMING ENTERPRISE.**—Mr. Ferguson, of Lone Pine, is about constructing a long flume from the mouth of the cañon on Murphy's creek, 8 miles north of this place, to Owen's River.

### LOS ANGELES COUNTY.

**SAN GABRIEL.**—Los Angeles *News*, Oct. 28th: A ditch has been completed from the head waters of the San Gabriel to the mines, a distance of 5 to 6 miles. This has a carrying capacity of about 500 inches.

### NEVADA COUNTY.

**MINING LOCATION.**—National *Gazette*, Nov. 1st: C. Johnson and others have four located claims on Orleans Flat.

**MARBLE QUARRY.**—Work is being vigorously prosecuted on the marble quarry discovered some time since, on Bear river, near Taylor's bridge on the Colfax road.

**SUCKER FLAT.**—The Nevada Ditch and Reservoir Co. have let a contract to raise their reservoir 6 feet. Work will be commenced this week.

**NEW YORK HILL MINE.**—Grass Valley *Union*, Nov. 1st: Work at this mine is being prosecuted vigorously with great success. The last crushing was one of 40 tons of ore, and the yield was \$1,080 or \$27 to the ton.

**HUESTON HILL MINE.**—Yesterday a clean up was made of 45 loads of rock crushed. The rock yielded \$2,790 or \$72 to the load.

Isaac Morris and others have located 51 claims in Relief Hill dist., commencing near where the North Bloomfield Gravel M. Co.'s ditch crosses Mission cañon.

**OLYMPIA MINE.**—This mine is located on the mountain beyond the Banner. They have been sinking on the ledge but a short time and getting out some excellent rock. It will pay at least \$50 to the ton.

**WATER TURNED IN.**—Water has been turned into the big flume at the head of the South Yuba Canal Co.'s ditch, in Bear Valley.

### PLUMAS COUNTY.

**A BIG CHUNK.**—Quincy *National*, Oct. 28th: It has lately come to light that some Chinamen working on the Middle Fork of Feather river, below Nelson Point, about 4 months since found a nugget weighing 14 lbs.

**MOHAWK QUARTZ.**—We are in possession of a specimen of the quartz recently discovered near Mohawk. The rock is of a reddish brown color, and gold, evenly distributed through it, is plainly visible. As the work progresses the rock improves in character, quantity and richness, and the vein is well defined, averaging from 2 to 3 ft. in width. Mr. Betterton has put up an arrastra, and will have it running in a short time.

**SALE.**—It is reported that all the ditch property controlling the waters of the lakes at the head of the Plumas ditch, on Spanish Peak, have been purchased during the past week.

**NEW DITCHES.**—The Ku Klux Co. have been at work for the past summer, digging ditches to convey the water from the head of Mill creek and the east branch of Rock Creek, to the Hungarian Hill country, where they have ground which is supposed to be valuable.

### SAN BERNARDINO COUNTY.

**RICH ORE.**—Los Angeles *News*, Oct. 28th: Some very rich ore from the Grain Pass mines, San Bernardino, is on its way to be forwarded to S. F.

### SANTA CLARA COUNTY.

**QUICKSILVER.**—San José *Mercury*, Nov. 2d: Work has commenced on the new quicksilver mine recently discovered on Maj. Vernon's ranch, a few miles south of Alamaden. The lode prospects well.

### YUBA COUNTY.

**MINES.**—Marysville *Appeal*, Nov. 3d: The miners in most of the hydraulic mines in this vicinity have suspended active operations while they put up their cuts and flumes, preparatory for the winter's work. But few of the heavy mines are now pining, most of them being engaged in repairing.

## Nevada.

### EUREKA DISTRICT.

**NORFOLK AND SUFFOLK.**—Eureka *Sentinel*, Oct. 31st: These mines consisting of 1,200 ft. each are within a few hundred yards of the road leading from Eureka to

Secret cañon. This property is being worked with more than ordinary encouraging results. Ores of fair grade in gold and silver are being extracted, besides galenas of such a desirable smelting quality that another furnace is contemplated.

**DON QUIXOTE.**—This mine is in the neighborhood of the Gen. Lee. A shaft is down 40 ft., 7 ft. in carbonate ore averaging \$102 per ton in silver, \$72 gold and about 50 per cent. lead. The Ida Elmore, another promising mine in the same vicinity, with the Don Quixote, is about changing hands at large figures.

**STRIKE.**—As the result of a few days work in the Tip Top mine a rich body of ore was struck in the old shaft. An assay showed \$30 in silver, and \$150 in gold.

**THE NEWPORT** is about one-fourth of a mile due south of the Bullwhacker and Otho mines; 3 locations have been made on the ground, all bearing the same name and running from No. 1 to No. 3. Men are engaged in all the various workings, but in the shaft of the original location is where the recent rich discovery was made. The main cut is down 12 or 15 ft. and for a greater part of the distance is in a solid mass of excellent high grade ore. There are 100 sacks of first-class ore on the dump. The ledge at the point of the late strike is from 5 to 7 ft. wide, and of indefinite depth.

### ELY DISTRICT.

**BULLION.**—Pioche *Record*, Oct. 29th: W. F. & Co. shipped since Oct. 22d, 10 bars of bullion valued at \$55,011.16, for the Raymond & Ely Co.

**OUR MINES.**—Ingomar is down 150 ft. will soon commence drifting; indication extremely good.... Little Giant is looking well throughout; down 50 ft. and still sinking.... Panaca shaft of Raymond & Ely is down 200 ft. perpendicular; still taking out immense quantities of rich ore.... Caroline struck good ore recently; down 45 ft. and still sinking; will soon commence sinking an incline from shaft; ... Lafayette is down 150 ft. and looking well throughout.... Newton Booth has just let a new contract for sinking 50 ft. more; the indications are improving as greater depth is attained.... No. 3 shaft of Mesdow Valley Co. is down nearly 400 ft.; raising and shipping large quantities of good ore.... Mary mine has a shaft down 45 ft. and still sinking; taking out good rock and improving as sinking goes ahead.... Khedive has a shaft down 50 ft. and will soon let a contract for running a cross cut; fine ledge with well defined walls all the way down.

### HUMBOLDT.

**BULLION.**—Unionville *Silver State*, Nov. 1st: Amount shipped from the Arizona mine, since our last issue, was \$6,476.

**THE RESULT.**—Clark Bros. recently shipped to the Auburn Mills, Reno, about 20 tons of ore from Central Dist., from which they realized \$90 per ton.

**ARIZONA CONS.**—The mine is showing exceedingly well.

**MILL STARTED.**—The new mill recently built in Dun Glen, was put in operation a day or two since.

**ECLIPSE.**—Work has been resumed with promising prospects. The ledge is 4 ft. in thickness, and producing ore of a very high grade.

### REESE RIVER.

**BULLION SHIPMENT.**—Austin *Reveille*, Nov. 1st: W. F. & Co. have shipped during the month of Oct., 155 bars of bullion, —14,220 lbs., valued at \$140,318.69, of which 122 bars valued at \$124,454 are from the Manhattan mill, and the balance of 33 bars, valued at \$15,864.58 from Belmont, from the Transylvania, Arizona, and El Dorado South mines.

Paxton & Co. have shipped during the same month, to the Bank of Cal. S. F., 38 bars of bullion, from Belmont, —2,841 lbs. and valued at \$18,097.43. Of that amount \$8,440.97 is from the Transylvania and Arizona mines, and \$9,656.56 from the El Dorado South.

**OUTSIDE ORE.**—Last week the Manhattan Co. worked 13½ tons of ore from Hall & Co.'s mine, Summit cañon, which produced \$207 per ton.

**FISH CREEK DIST.**—This Dist. is about 16 miles southerly from Eureka, and 4 miles south east of Spring Valley. Quite a number of promising claims have been opened, and indications for the future prosperity of the Dist. are favorable. Considerable quantities of high grade smelting ore have been already extracted.

**NICH PLUM.**—The Richmond boys have received the balance of their money, \$125,000, due them from the sale of their property.

### WASHOE.

**THE NEW EUREKA MILL.**—Excellent progress is being made in the work of build-

ing this huge new mill of the Union mill Co., on Carson river.

**MERRIMAC MILL.**—They have been enabled to start settlers on tailings and expect in a few days to be able to run a few stamps.

**BRUNSWICK MILL.**—The new mortars of the Brunswick mill, Carson river, are being put in and the batteries will soon be completed. The pans are already up, and the settlers are being set.

All the mills along Six and Seven-mile Cañons are in full blast.

**ROCK POINT MILL.**—The Rock Point mill, Dayton, will start up next week on Belcher ore.

**OPHIR MINE.**—The Ophir shaft is down 1,100 ft. and a set of timbers for the 1,100-ft. station is being put in. The rock continues to work well and no water is coming in to discommodate the workmen.

**CHOLLAR-POTOSI MINE.**—This mine is now yielding 150 tons of ore per day, assaying upon the average \$45 per ton, making the weekly yield \$40,500. The Co. shipped \$31,000 in bars day before yesterday. Those portions of the mine in which prospecting is being done are looking exceedingly well, and stopes in the old works are yielding the usual quantity and quality of ore.

The Savage mine yielded 500 tons of ore last week, assaying \$37 per ton, or about \$18,000 in bullion.

The Hale & Norcross Co. are still engaged in re-timbering their main shaft. They extracted about 250 tons of ore last week.

**CUNDURANGO.**—The Cundurango is attracting much attention at present. It is the north extension of the famous Hooker, and even at the very surface is rich in silver.

**SUTRO TUNNEL.**—The tunnel was yesterday in a distance of 2,500 ft.

**CROWN POINT.**—Gold Hill *News*, Oct. 31st: The two hoilers heretofore in use at the Crown Point hoisting works, which have been removed to give place to larger ones, are to be taken to the Brunswick mill, Carson river. The cross-cut at the 1,200 ft. level of the Crown Point has reached the east wall, and shows the full width of the ore body to be 67 ft. It is fully demonstrated that at this level the ore body extends 10 ft. further north than in the level 100 ft. above.

### WHITE PINE.

**BULLION.**—W. P. *News*, Nov. 1st: The Monte Cristo Mill and M. Co. shipped, yesterday, 3,186 ozs. of bullion, valued at \$4,029.34.

**EDGAR.**—Drifting continues from the 110-ft. shaft. The ore-body is 20 ft. and increasing in width. The general dip of the ore is to the east. This immense body of ore, as far as assayed, averages \$50 per ton.

**ICEBERG.**—The ore continues to look well.

**EAST SHEBOYGAN.**—The ore in the workings mentioned last week is increasing in quantity. The south drift from the original tunnel, is pushed ahead 20 ft., with ore the whole distance. Connection with the Exchange and Regent shafts is nearly complete, and when made, a force of men will commence stoping. A drift will start up next week to connect the Exchange shaft with the original tunnel, and when made there will be a 200-ft. breast of ore opened.

**MANHATTAN.**—Recently a body of ore, the extent of which we do not know was developed. Seven assays ranged from \$21 to \$182 to the ton.

## Arizona.

**PROSPECTORS.**—Prescott *Miner*, Oct. 21st: Several parties have left here lately on a prospecting tour. The last of these left on Wednesday for Copper Creek to prospect for silver ledges.

Among the late discoveries, is a lode at Turkey Creek, 2½ miles below the Bully Bueno mill; the surface indications have never been excelled by any mine in the Territory. The discovery was made in the early part of the present week and has been named the Compton lode. Native silver, chloride, black sulphuret and horn silver abound in the croppings, and some 100 pounds of the ore brought to town present all these in abundance. The thickness of the ledge varies from 12 to 15 ft. at the surface, and in the centre of this is a stratum about 2 ft. thick in which native silver and black sulphurets are plentifully interspersed.

**FLORENCE.**—The Pinal prospecting expedition claim to have discovered valuable gold mines during their visit to the interior.

**MINERAL PARK.**—The mines are turning out richer ore every day; 5 men are at work on the "Lone Star," taking out 50 tons of ore for the mill. To-morrow the

Mayflower Co. will commence taking out ore for the mill.

There has been some very rich strikes near Empire, and ore is being shipped daily. At Cerbat, Peo & Co. are shipping ore from the "Vanderbilt" and "Champion." Slaven & Co. are shipping from the "Tigress."

Colorado.

Mr. Berg, working the Union No. 4 lode, at Buckskin, Park Co., is taking out large quantities of rich silver ore; 6 men are employed. The Union No. 4 has been worked as a gold lode, and this silver vein is a new development, having been found 100 ft. below the surface—that being the depth of the shaft. A tunnel has been driven into the vein at a distance of 50 ft. from the entrance.

S. McCLELLAN and T. Holson have leased the Lexington (21 stamps) mill up Novada St. and started up work to-day.

PARK CO.—Cor. Central Register, Nov. 1st: On Mt. Brown the Moose is opened about 40 ft. in length, and in depth is about 20 ft. The vein is about 2 ft. wide, and averages, by assay, \$160 per ton. The Dwight opened about the same in length and depth as the Moose, and contains the same class of ore. Three men are employed in getting out the ore from the 2 veins. Below the Dwight, 4 veins have been discovered, and a tunnel has been commenced at right angles. The excavated limestone shows mineral all through it. About half a mile below the Dwight is the Fairview, which has been traced several hundred ft. The depth is 10 ft., which shows 2 veins, one of galena 2 ft. wide, and the other of honey-comb quartz 18 inches wide. The latter prospects large in gold. The Tar Heels, though only sunk about 6 ft., assays \$300 per ton.

On Mt. Lincoln may be mentioned the Wilson, Haynes, Lincoln, Alps, Monson, and Musk Ox. Each of them contain large quantities of ore from which large assays are obtained.

Safford, Sykes & Co. own 4. One of them, the "Musk Ox," contains ore equal to any yet found. Two assays recently made, gave \$1,326.90, and \$473.80 per ton. O. M. Jones owns 7 veins on Mt. Lincoln, 2 on Mt. Brown, and 3 near the head of Buckskin gulch, which give assays up to \$700 per ton.

Summit Co.—W. King is developing his lode in Pollock Dist., and is getting out some very fine ore.

During the past 6 weeks 8 additional lodes have been discovered in the vicinity of Ten Mile, all free gold, and said to prospect large. The owners propose to construct arrastras next spring.

Two months ago Carney, Crawford, and others, discovered a silver lode near the head waters of the Arkansas and Ten Mile. They claim to have a well-defined crevice 2 ft. wide.

Greenleaf & Co. have completed their ditch from the Blue to Klak gulch. It is 200 rods long, and capable of furnishing from 1,000 to 2,000 inches of water during the highest stage of water in the Blue.

W. McFadden has sold his interest in Illinois gulch for \$5,000 dollars and his interest in a new discovery of placer ground for \$800.

C. Bledsoe discovered, last fall, in the vicinity of Ten Mile, a free gold-bearing lode, which he developed recently, and found a well defined crevice 3 ft. between walls. The ore is about three-fourths decomposed, and 25 pans of it averaged \$1.53 to the pan.

St. Lawrence Co. will complete their Arey furnace as near as possible this winter, and have let 2 more contracts on their 2 lodes, the Silver Wing and Napoleon. The ore from both lodes increases in value as the tunnels are driven. About 25 men will be at work there this winter.

The Boston Co., at St. Johns, will work a number of men on their lode and on their new works. A number of other lodes in that section are turning out some very rich ore.

Montana.

KEATINGVILLE.—Cor. Deer Lodge News North West, Oct. 28th: In the Keating mine two levels have been run one, 100 feet and another at 172 feet in depth, which have been worked north of discovery shaft 370 feet and south of it 600 feet, taking out a body of ore which has averaged \$20 per ton from a crevice varying in width from 20 inches to 2 1/2 feet. The mill has a capacity of 24 tons per day, and has paid \$9,000 to \$10,000 per month from the date of starting up. The Ohio mine has a 70 foot shaft on No. 1 south has been worked to that depth, uncovering a 3 foot crevice of No. 1 ore. They are at present driving in a 240 ft. level.

Utah.

BULLION.—S. L. Tribune, Oct. 30th: During the past week Woods & Cutting having shipped to New York, 3,080 bars of base bullion weighing 335,398 pounds.

Walker Bros. shipped to New York 5 bricks of fine bullion from East Cañon worth in the aggregate \$7,000.

W. F. & Co. sent to New York 8 bars of Pioche bullion, from the Meadow Valley works worth \$10,822.50.

On the 26th they received from Walker Bros. 5 bars, 384 lbs., valued at \$6,893.22, and from Pioche, 8 bars, 933 lbs., valued at \$10,822.50 from Raymond & Ely's works. On the 2d (same paper Nov. 3d) they received from same place from Meadow Valley Works 18 bars worth \$21,239.36 to be forwarded to New York to day. On the 1st they forwarded to New York 19 bars Pioche bullion worth \$55,011.16.

THE MONARCH.—East Cañon is better than ever before, with a 5 foot vein of solid chlorite.

MOUNT NEBO M. DIST.—The mine is looking well. The Olive Branch shows over 4 feet solid carbonate ore assaying on an average over \$30 per ton. The Sultana is looking splendid, and every lode that has been worked on improves with the depth.

LITTLE COTTONWOOD.—The Vallejo is yielding from 10 to 15 tons of ore daily, which will work at least \$100 to the ton.

Work on the tunnel of the Little Cottonwood Silver M. Co. has been pushed into the mountain more than 200 feet, having passed through two small veins of ore, which were not deemed sufficient to warrant drifting or sinking upon, the company preferring to push ahead with all their forces for a larger body of ore, which they feel confident is not very far distant in the hill.

EAST CANON.—On the west front of Lion Hill the original Lion claims 1,600 ft., much of which, along near the North Webster shaft, is in the deep rock ent. The Blue Wing shaft, near it, is down 75 ft. and shows the same kind of ore. The Mormon Bello and Blue Wing No. 2 all show the same connection of ore. The deepest work in this lot is now 100 ft. from the surface.

Below the Zilla, on that spur of Lion Hill nearest the cañon, is the Tenderfoot, an important location. The incline is in 30 ft. from the surface rock, showing a good body of ore at the termination, and some all the way from the surface. It is claimed the ore is worth \$1,000 per ton. Another tunnel has been started below, and work upon both is being prosecuted vigorously. The Silver Chief, still lower down shows a large body of average or low grade ore.

At Ophir, the Ida Elmore men have stripped their vein for 12 ft. further up the hill, showing it continuous between the formations. In this last portion, black sulphurets of silver predominate. The same men have opened, on the other side of the gulch, a vein which can be traced 1,000 ft. by occasional croppings.

Among the most noted mines on Silver Hill is the Occidental, about half a mile west of the Silveropolis. It cuts the formation nearly exactly at right angles and can be traced for 2,000 ft. The first tunnel defines the footwall for 60 ft. Another shaft, 100 ft. from the first, shows the same wall well defined. The vein is from 2 ft. thick to 10, but in the latter width, of variable material. Assays from the "top rock" ran from \$12 to \$28; at the depth of 100 ft. in the main shaft from \$100 to \$2,000. A picked piece of sulphurets yielded \$4,740.55.

In the Tiger, Lion Hill, the main chamber is on a level with the track tunnel from which, at a distance of 80 ft. from the entrance, a large stope bears off to the right and upward to the next chamber. There a cross cut straight east and west shows ore for 40 ft.

The vein, which has shown very wide in the Tiger, sinks to 2 ft. on entering the Rockwell, then widens to 6 ft.; but the ore is much richer than in the former. The Mountain Tiger, Rockwell and Bella may be considered as one. The shaft is but 25 ft. from the Bella, and shows a rapid improvement in the vein. Where furthest into the hill the vein is at least 12 ft., the shortest line from foot to hanging wall; but owing to the incline the 3 chambers amount to 18 or 20 ft. of perpendicular.

The Lone Star is looking very well. It is one of the latest discoveries. The Antelope looks good.

FURNACE AT WORK.—One of the furnaces of the Sultana works, in American Fork commenced operations last Tuesday, and is making a good run.

Mining Stock Market.

THURSDAY EVE., Nov. 9th, 1871.

Stocks have looked up again this week, and prices are fairer since our last review.

The sales at the San Francisco Stock Board, for the week ending last Friday aggregated \$2,370,300. From the Raymond & Ely mine \$56,050 were received, making a total of \$215,225 for 25 days run of the fiscal month. On October account, \$173,000 have been received from the Meadow Valley mine. The October receipts of the Chollar Potosi, were \$73,143. The sum of \$21,000 has been received on October account from the Caledonia mine. The suspension of J. B. E. Cavalier, President of the Stock Board was announced this week. He was a sufferer by the Sime Bank failure. October receipts from the Kentucky \$20,071. The Territorial Enterprise of the 7th inst. contains a statement of the yield of the principal mines in Storey county, Nev., for the quarter ending Sept. 30th, as returned to the Assessor. The total amount of ore reduced for the quarter by the 12 mines reported, is \$3,680 tons; gross yield \$1,987,674. The actual cost of extracting was \$748,908; actual cost of reduction \$16,577; leaving a profit of \$422,000.

The following is a statement of the gross bullion yield of each mine and average per ton:

Company.	Gross Yield.	Per ton.

N. Seibert's Eureka Lubricators for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First Street, San Francisco. 8/23-3m

LADIES DESIRING TO PURCHASE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 24 Bovey, 137 E. 26th, 477 9th Ave. New York Good work at high prices if desired. 21v1-12mbp

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post Street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for business, by Clark, and Bookkeepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Ask for a circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10v2bhp-3m

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Coca says "You are invited and manufacturers have attempted to attain a reputation for their prepared Cocoes, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary value of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we cannot recommend it more as a valuable beverage." Sold in packets only by all grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brix Lane, London. Export Chocery Mills, Bruges, Belgium. 1625-ly

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors. Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught. Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. 563bptf

COUGHS AND COLDS.—Those who are suffering from Coughs, Colds, Hoarseness, Sore Throat, &c., should try "Brown's Bronchial Troches," a simple remedy, which is in almost every case effectual. The Troches have been tested by time, and pronounced universally superior to all other articles for the same purpose.

\$5 TO \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7 strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

THE VISALIA DELTA has been recently enlarged, and is now one of the largest, best printed and most extensively circulated local weeklies in California. A new job press and material have lately been added to the office to meet the wants of a thrifty and growing community in one of the most promising agricultural districts of the State. E. M. Dewey, proprietor.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

A good practical assay of tailings, sulphurets, etc., is made by chlorination. To conduct it successfully requires considerable skill and very careful manipulation, but the details are not difficult to understand or practice.

Sulphurets must first be roasted, to remove arsenic, sulphur, etc. This may be done in an iron pan over a stove or open fire. Of course the ore must be weighed before it is roasted if it is desired to ascertain its value. If an iron pan is used for the roasting, it must be first coated with chalk to protect the iron from the action of the sulphur. This may be done by mixing whiting or pulverized chalk with water and applying it in the form of paste with a brush; several coats may be necessary. Three hundred or four hundred pounds of ore is a convenient quantity to treat at once.

The apparatus required will be a strong water-tight harrel with one head removed. Three inches from the bottom, a second or false bottom is fixed which is pierced full of small holes. Between the bottoms and on one side a half-inch hole is bored to allow of the introduction of a small lead pipe which connects with the generating apparatus. This hole must be so low down that every drop of water will run out through it, and when in use the harrel is placed in a position slightly inclined to facilitate such flow. The harrel is placed on a board larger than its base. The board is also slightly inclined and cut with grooves centering at a single point. The edge of the board must project over its support so that a suitable vessel may be placed under it when required.

When the harrel is placed in position, one thickness of gunny sack or other very coarse cloth is laid over the holes in the false bottom. The object of this is that the gas may pass freely, but that no ore can fall through. The roasted ore is then made slightly damp with water and placed loosely on the cloth. Care must be taken in filling the harrel to have the ore as loose as possible. When the harrel is full it is covered with a cloth and then with a tight cover.

The generator is a large flask of glass capable of holding at least a gallon. To the neck is fastened a good cork, pierced with two holes through which pass tubes of glass which are at least half an inch in internal diameter. One tube rises a few inches above the cork and passes down to within an inch of the bottom of the flask inside. The other tube only passes an inch below the cork, and at an inch or two above, bends at a right angle and connects with a washing hottle.

Coarsely pulverized bin oxyd of manganese is placed in the flask to a depth of two inches. A little water is added and the whole shaken. The cork and tubes are then properly replaced and the generator is connected with the washing hottle and the washing hottle with the harrel so that its tube will pass through the hole between the bottoms. This joint must be made tight, either by calking with rags or with a lute made of linseed meal and plaster of paris in equal proportions.

The washing hottle is simply a hottle with a wide neck. Its capacity should be about a quart. It is fitted with a good cork and half filled with water. The tube from the generator passes through the cork and ends below the water. Another tube commences in the same cork but above the water. The other end of this tube is the one which connects with the harrel. The object of the wash hottle is to retain any acid which might pass over with the chlorine.

When the apparatus is arranged and it is certain that all the joints are tight, a small funnel of glass is placed in the end of the open tube of the generating flask, and common muriatic acid is poured little by little into it. The acid passes down to the manganese. No gas can escape by that tube as its end is under the surface of the water. As soon as action begins chlorine is generated, and there being no other

outlet, passes through the bent tube to the wash hottle. As it bubbles through the water it leaves any acid which may have passed over with it and passes on pure and dry to the harrel. The stream of chlorine must be continued for several hours, according to the quantity of ore treated. If action in the generator begins to be sluggish the flask may be placed in a vessel of hot water or upon a sand bath over a gentle fire. If after several hours, on lifting the cover of the harrel a stifling smell of chlorine and a greenish colored gas is observed, the operation may be considered as finished. The generator may or may not be disconnected and the harrel left undisturbed for twenty-four hours. If the generator is not disconnected the water of the washing hottle may pass over to the flask, but that will do no harm.

The action which takes place in the harrel is as follows: three equivalents of chlorine combine with each equivalent of gold forming the ter-chloride of gold, which is soluble in water.

After the proper time has elapsed hot water is poured in small quantities at a time upon the top of the ore in the harrel, the small hole in the bottom being first opened and a vessel placed to receive what passes through. This is best done with a small watering pot to insure an even distribution. The water is applied in small quantities at a time. After a time a dark colored fluid appears at the hole and following the grooves in the board upon which the barrel is placed falls into the

verized. What passes the ordinary battery is fine enough.

2d. The ore must be thoroughly roasted. No smell of sulphur must be given off when the operation is finished.

3d. The ore must not be too wet and must be placed as loosely as possible in the harrel.

4th. The stream of gas must be continued until the whole mass is saturated.

5th. Water must be added by very small quantities at a time, and the operator must be sure that all the gold has been washed out.

6th. Great care must be taken to lose no particle of the gold in transferring the contents of the flask to the filter.

By carefully observing these rules the mill man possessing ordinary judgment can make practical assays of his own tailings and sulphurets, and thus ascertain if they are worth shipping or if they are rich enough to warrant the erection of chlorination works.

## Barthel's Improved Gate.

No doubt many of our readers may have seen, at the late Mechanics' Institute Fair, the gate of which our engraving is a representation. To those who have not, however, some slight description will be necessary. The object of this gate is to allow a passage through the gateway without the inconvenience of getting in and out of a

BARTHEL'S IMPROVED GATE.

vessel placed to receive it. The leaching must be continued until the water comes off colorless, and until a portion after being acidulated with muriatic acid, gives no precipitate with a solution of sulphate of iron. The contents of the harrel are then worthless and may be thrown away. The dark colored fluid which contains all the gold, must then be slightly acidulated with muriatic acid and a saturated solution of sulphate of iron poured in as long as any precipitate falls. The solution of sulphate of iron must be clear, made so either by filtration or settling.

The precipitation is best conducted in a glass flask like the one used for the generator. If the quantity is large several flasks may be used. After standing for some time to settle, a few drops of the iron solution is poured in, and if no more precipitate forms, the operation is completed, and the whole contents of the flask may be poured on a good paper filter placed in a glass funnel. What passes through, if clear, may be thrown away, but the black powder, which is the gold, remains on the filter and may be washed with clean water and the whole dried in the funnel. When the filter is dry, it may be removed from the funnel and carefully rolled up and placed in a crucible with fluxes and melted in the manner before described. When the crucible is cold it is broken, and the button of pure gold weighed and its value calculated.

Suppose 400 pounds of the ore was operated upon, and the bullion weighed .072 of an ounce Troy. It is evident that 2,000 pounds or a ton would give five times as much, or 0.36 Troy ounces. An ounce of pure gold being worth \$20.6718, this multiplied by 0.36 would give the value of a ton.

$20.6718 \times 0.36 = \$7.44$ —the value per ton.

Certain precautions are to be observed in this process, which is the best and simplest for sulphurets.

1st. The ore or sulphurets must be pul-

carriage or other vehicle. By the use of inventions like these, one need have no fear of restive horses, nor be compelled to get out and lift a heavy gate, by main strength, as is frequently the case, in order to pass through. You can drive up and by a slight pull on the rope the gate is opened; after you are inside, or outside, as the case may be, another pull on the other rope, and it is closed without the slightest exertion or trouble.

This contrivance consists of a gate having a horizontal axis upon which it turns, near the bottom, so as to remain steady when open. A post sufficiently high is placed near the end of the gate, and arms extend in either direction so that the operating cords will hang convenient for use when approaching from one side or the other. These cords pass over pulleys at the top of the post, and thence around a large wheel or pulley near the top of the gate, so that the wheel can be turned by them in either direction. An eccentric pulley is attached to this wheel, and the cords which move the gate pass around it, so that when the gate is first started the cords act upon the smallest radius of the eccentric, and thus have the greatest power. A sort of latch is so fixed as to hold the gate in place when open or shut, and the operating cords act on this latch and raise it before the gate is moved. By this device the gate is so balanced that it will remain in either position without being excessively heavy to open or shut. The counter-balance consists of a weight which is attached to an arm, wheel, or eccentric, and is so calculated as to nearly balance

the gate in all its positions and allow it to be easily moved.

It will be seen there is no intricate mechanism in connection with this device, and that in fact there is no machinery whatever, since the whole contrivance is so poised as to be easily raised or lowered by simply pulling a rope. This being the case, there is no danger of it getting out of order, and the latch precludes the possibility of it falling when up, or being raised when down, without having recourse to the rope. When a neat and convenient gate like this can be easily procured it is a pity to see so many tumble-down ones as we do in traveling through the country.

This invention, the patent for which was obtained through our agency, was devised by Michael Barthel, of Pacheco, Contra Costa County, Cal., from whom further information may be elicited by addressing as above.

## Mechanical Progress.

Reader, did you ever stop to inquire what the condition of the present age would be were it not for the steam engine and the telegraph? No doubt you have often thought: "What a great thing the steam engine is;" or, "How convenient the telegraph;" but their real value to the world can only be arrived at by imagining ourselves deprived of their present use.

Without the steam engine our travelers would be compelled to ride on horseback as the most expeditious method of going from place to place. By this means an ordinary trip across the plains would consume a large part of a year, and would be fraught with trials and sufferings such as can be realized only by those who have made such a journey. Instead of receiving a daily mail, seven days from New York, we would have to go back to the old pony express, and wait two or three months to receive a reply to a letter written to our friends in the East. Instead of "A trip across the world in ninety days," we would have to wait for wind and tide, and in an ordinary sailing vessel make the voyage at the expense of two or three years. Not only is the steam engine a great convenience for travelers, but its power is exercised in constructing our cities, our docks, our public works; in fact, it would be hard to mention any department of business in which it is not employed.

Without the telegraph, business men, especially importers and exporters, would be doing a grand lottery business half the time. By means of the telegraph we are enabled to converse with friends thousands of miles away, in the space of a few moments. Hardly had the fire which recently swept away a great portion of the city of Chicago, fairly commenced to burn, ere the telegraph announced to almost every part of the world the fact; and as the dire calamity progressed, the telegraph transmitted to the waiting thousands the hopes, the fears and doings of the people, and the chances of saving the city; and ere the rains had ceased to burn, the same telegraph sent back cheering words of comfort to the homeless and houseless sufferers.

Without the railroad and the telegraph the United States would be too large to be held under one confederation. By its means a continual circulation of its population is kept up which induces friendship and a fellow feeling. We are now as a single neighborhood, able at any moment to communicate with our neighbor, or jump aboard the car and make him a call. By being able to do and act speedily, wrongs are redressed and rights established, where otherwise the wrong would slumber and the right be suppressed until open rupture would end all.

Take away the steam engine and the telegraph, and render their invention impossible, and we put our foot upon progress, and doom the world to an unequal, cold and gloomy barbarism, during which the dark ages would repeat themselves, and mankind be little better than the brutes.

## USEFUL INFORMATION.

## Why do not Animals Talk?

They would, if they had anything to say. There must be a very nice correspondence between the muscular construction of the mouth, the vocal apparatus at the top of the windpipe, and the brain in order to produce articulate language. None of the carnivorous animals, such as dogs, lions, tigers, cats, etc., have snug, tight-fitting lips. On the contrary, they have no circular muscles, as in man and the grass-eating animals. Their lips are pendulous, as may be noticed, sagging by their own weight, exposing some of their under-jaw teeth. Even if they had thoughts, they could not be symbolized by articulate sounds, because labials could not be produced. In the social animals the brain, in proportion to their bodies, is exceedingly small, and therefore supposed to be inadequate to mental operations beyond the manifestations of their instincts. A few birds possess an imitative faculty of copying and reproducing the voices of others, but the range of their articulation is confined to lingual sounds exclusively, because their horny beaks admit of no flexibility for varying a tone. Man alone is a talking being.

Still all animals, and even insects, have a method of making their wishes and intentions known to each other. How they do it is still a secret for which no opensesame has been discovered. Bees, wasps, spiders, beetles, and common house-flies comprehend the meaning of their kindred associates. So do horses, oxen, cows, and all the wild animals of the forest. Wolves concert attacks requiring not only a strong force, but stratagem; and to complete any proposed expedition of a formidable character implies exact acquaintance with all minutiae of an expedition. How is a plan explained without words? That is a grave question.—*Etc.*

## Facts About Ropes.

"Alston's Treatise on Seamanship" gives the following facts and rules for computing the strength of ropes:

To find what size rope you require, when roven as a tackle, to lift a given weight, divide the weight to be raised by the number of parts at the movable block, to obtain the strain on a single part; add one third of this for the increased strain brought by friction, and reeve the rope of corresponding strength.

One-sixth of 40 tons is  $6\frac{2}{3}$  tons, which, with one-third added, is 9 tons nearly, for which you should reeve a six-inch or six and a half inch rope.

Conversely: To find what weight a given rope will lift when rove as a tackle: Multiply the weight that the rope is capable of suspending by the number of parts at the movable block, and subtract one-fourth of this for resistance.

Thus: 8.9 tons, the strength of the rope, multiplied by 6, the number of parts at the movable block, minus  $13.3$  or one-fourth, gives 40.1 tons as the weight required.

Wire rope is more than twice the strength of hemp rope of the same circumference; splicing a rope is supposed to weaken it one-eighth.

The strongest description of hemp rope is untarred, white, three-stranded rope; and the next in the scale of strength is the common three-strand, hawser laid rope, tarred.

**A BONE CRUSHER FOR DOMESTIC USE.**—At the last fair of the Smithfield club, Islington, the house of Hancock & Co. exhibited a new and exceedingly useful invention, namely, a machine for crushing and grinding bones by hand, so that a cook could break, crush, or grind bones to any desired size. As a quarter of a pound of bone contains as much gelatin as a pound of meat, it stands to reason that a machine that enables us to recover the whole of this, and, at the same time, reduce the bones to a condition ready for conversion into superphosphate, must prove decidedly successful. The crusher is made of steel and cast iron, and can be screwed to a block or solid table; and it costs in London one pound twelve shillings.

Such a machine would be very valuable on every farm to crush and grind bones for the above-named purposes, and for feeding to poultry. If some one of our California inventors would set themselves to work, and produce a machine that would accomplish what is above set forth, they would have an invention which ought, and one we think would, pay.

## Painless Killing.

In regard to the freedom from pain incident to death produced by carbonic acid gas when administered in large quantities, it may be interesting to note that, in large foundries, where iron is melted in cupolas, there is always a large quantity of carbonic oxide passed into the stack. This volume of gas in some instances cannot escape freely by the flues, and blows out of the charging door. Sometimes workmen in the act of charging the cupola, are deluged by a flood of the gas, and in all cases fall instantly insensible, and would die if not dragged away from the poisonous atmosphere. When restored to consciousness they cannot remember any sensation of any kind—certainly none of pain attending their insensibility. In one instance a workman engaged in repairing a furnace in this city, remained in it while an adjacent one was put into blast. The superabundant gas passed partially into the place where he was working, and so quickly did he succumb under its influence as to cut short something he was saying to those outside, so as to show that between the time of uttering one word and another to all appearance he was dead. It was with the utmost difficulty that he was restored, and he had no recollection of what had happened. It has been a matter of considerable interest whether this result is brought about by the carbonic acid or by the carbonic oxide gas. Some who have breathed pure carbonic oxide gas have noted this effect, while men plunged suddenly into carbonic acid gas, as in wells, have as suddenly become insensible.—*Philadelphia Ledger.*

## Adulteration of Lard.

Some time ago, the stock of prepared lard being exhausted, a quantity was procured from a respectable pork-dealer. It was beautifully white; so much so, that the writer was led to question his ability to produce anything equal to it. The first trial was in preparing ointment of nitrate of mercury. The color, when the mercurial solution was added, was the reverse of citrine, indeed decidedly saturnine, developing in a short time to a full slate color. Surprised at this unprecedented result, the usual precautions having been taken as to temperature, etc., the lard was suspected, and on examination, was found to contain a large proportion of lime. Some time after, being in conversation with a lard-renderer, a hint was dropped as to the relation of lime to color, when the information was confidentially imparted that a common practice among lard dealers was to mix from two to five per cent. of milk of lime with the melted lard. A saponaceous compound is formed, which is not only pearly white, but will allow of the stirring in, during cooling, of 25 per cent. of water. So much for appearances.—*Canadian Pharmaceutical Journal.*

## To Transfer Ornaments to Carriages, Wagons, Etc.

This beautiful art is now practiced by many painters, who are either in a hurry with their work, or for economy's sake.

Pictures expressly designed for carriages are now sold, and the amateur painter is enabled thereby to finish a job of carriage painting in fine style.

These pictures may be stuck on, and the dampened paper carefully removed, leaving the picture intact upon the panel, requiring no touching with the pencil. The proper way to put on decalcomanie pictures is to varnish the picture carefully with the prepared varnish (which can be obtained with the pictures,) with an ornamenting pencil, being sure not to get the varnish on the white paper. In a few minutes, the picture will be ready to lay on the panel, and the paper can be removed by wetting it, as already described; and when thoroughly dry, it should be varnished like an oil painting. Be particular to purchase none of those transfer pictures, except those covered with gold leaf on the back, for they will show plainly on any colored surface, while the plain pictures are used only on white or light grounds.—*Painters' Manual.*

**THE NEWSPAPER OF TO-DAY.**—One man in a hundred reads a book; ninety-nine in a hundred read a newspaper. Nearly a century ago, when the American press, which is now a spreading oak, was in its green twig, Thomas Jefferson said he would rather live in a country with newspapers and without a government, than in a country with a government but without newspapers. The press, instead of being the fourth, is the first estate of the realm.

## GOOD HEALTH.

## Chewing Gum a Bad Habit.

In most of the Eastern States the habit of chewing gum has become quite general, especially among school girls. We are not aware that it has been very generally introduced into California, and we trust it never may be. A gentleman lately while passing along the streets of a western city counted in 15 minutes no less than 70 ladies who were "chewing" what he supposed to be gum.

Dr. T. F. Hicks, in a late number of the *Medical Independent* talks as follows upon the bad effects of this habit:

Of course it will not be pretended that this habit is either as injurious or as nasty as that of chewing tobacco, yet it is not all together innocent.

When food is taken, saliva is secreted to aid in masticating it. When other substances are chewed, saliva is, at first, secreted as for food, but the vital instincts soon recognizing the nature of the substance, excrete a fluid similar to saliva for the defence of the tissues. This fluid (thrown out against tobacco, gum, etc.) is really an excretion. The hile occasioned by taking poisonous medicines has, by careful experiment and analysis, been found to be quite a different substance from that secreted by the liver in its healthy action. So the fluid which the salivary glands produce during protracted chewing of that which is not good food, is quite different from healthy saliva. The waste, however, is probably just as if it were healthy saliva. Those who habitually chew gum unduly exercise the salivary glands, thus wasting vital force and injuring the glands, occasioning in them either ultimate debility, or undue development in size. There is also danger of permanent depreciation and poisoning of the salivary glands.

**CHILDREN'S HEADS.**—It is astonishing how many mother's neglect the daily practice of washing their children's heads. It is equally astonishing how few really good mothers appreciate the benefits arising from a morning bath for the head. It is just as essential to wash the head as the face—more so in fact. The head should be washed before the face, rubbing it lively with the fingers, this restores to activity all the latent vital forces, secures a perfect circulation, brightens the ideas, and gives a healthy tone to the growing hair.

A head that is washed in cold water every morning is never troubled with dandruff, or diseases of the scalp—the hair grows soft and abundantly, and headaches are seldom beard of. Children living in the country especially, and playing in the dust and dirt all day, should have the benefits of this practice regularly.

**WATER AND HEALTH.**—It has been ascertained in Great Britain that the death-rate among men and animals is very sensibly affected by the quality of the water they drink, whether hard or soft. The hard is much more favorable to health. Thus, those who live over the lime of the coal formation, with the shales, and marls, and magnesian limestones of the sandstone formation, where the waters are hard, surpass the average of the country in height and weight. The tallest men of England are over the limestones of Yorkshire. The finest breeds of horses and cattle originate in the hard-water tracts. On the other hand, the diminutive Welch and Highland sheep, and the Highland pony, are found in the soft-water regions, among the gneiss and slate.

**SLEEPLESSNESS AND INDIGESTION.**—"How should sleeplessness in a very young babe be treated? Also, what will cure indigestion and acidity of the stomach?"

Cure the indigestion, and the sleeplessness will disappear. To do this, feed the baby less frequently, and do not allow it to take anything whatever into its stomach except milk, and that only at certain stated times, not less than three hours apart. If the acidity does not soon disappear, extend the time to four hours. Be sure and be regular in the times of feeding. It is very important.—*Herald of Health.*

## Things to Remember.

Edward Everett became overheated in testifying in a court-room, went to Fanenil Hall, which was cold, sat in a draught of air until his turn came to speak: "But my hands and feet were ice, my lungs on fire. In this condition I had to spend three hours in the court-room." He died in less than a week from thus checking the perspiration. It was enough to kill any man.

Professor Mitchell, while in a state of perspiration in yellow fever, the certain sign of recovery, left his bed, went into another room, became chilled in a moment and died the same night.

If, while perspiring, or warmer than usual from exercise, or in a heated room, there is a sudden exposure, to chill cold air or a raw, damp atmosphere, or a draught, whether at an open window or door, or street corner, the inevitable result is a violent and instantaneous closing of the pores of the skin, by which waste and impure matter, which was making its way out of the system, is compelled to seek an exit through some weaker part. To illustrate: A lady was about getting into a small boat to cross the Delaware, but wishing first to get an orange, she ran to the bank of the river, and on her return to the boat found herself much heated, for it was summer; but there was a little wind on the water, and her clothes soon felt cold, which produced a cold that settled on her lungs, and within the year she died of consumption.

A Boston ship-owner, while on the deck of one of his own vessels, thought he would lend a hand to some emergency, and pulled off his coat, worked with a will, until he perspired freely, when he sat down to rest awhile, enjoying the delicious breeze from the sea. On attempting to rise he found himself unable and was so stiff in his joints that he had to be carried home and put to bed, which he did not leave until the end of two months, when he was barely able to hobble down to the wharf on crutches.

Multitudes of women lose health every year, in one or more ways, by busying themselves in a warm kitchen until weary, and then throwing themselves on a bed or sofa, without covering, and perhaps changing the dress for a common one, as soon as they enter the house after a walk or shopping. The rule should be invariably to go at once, into a warm room, and keep on all the clothing for at least five or ten minutes, until the forehead is perfectly dry. In all weathers if you have to walk or ride on any occasion, do the riding first.—*Hall.*

**REMARKS UPON MEDICAL RECEIPTS.**—Emergencies often occur in every family when the services of a physician cannot be procured promptly, and something should be done while "waiting for the doctor." Many of the "Medical Receipts" which we give from time to time, may answer the valuable purpose of relieving suffering humanity until medical attendance arrives. Slight cases of sickness may often be relieved by simple remedies, if used in time, without calling in a physician; but judgment and discretion must be used in giving even "simple remedies."

**CIDER FOR A COLD.**—Common sweet cider boiled down to one-half, makes a most excellent syrup for coughs and colds for children—is pleasant to the taste, and will keep for over a year in a cool cellar. In recovering from an illness, the system has a craving for some pleasant acid drink. This is found in cider which is placed on the fire as soon as made, and allowed to boil, then cooled, put in casks, and kept in a cool cellar.

**AS THE BABYLONIANS** had no physicians with whom to consult in case of sickness, they adopted a novel plan to obtain relief under such circumstances. They had the infirm brought into the Forum, and those who passed by were asked their opinion as to the nature of the disease. They demanded of each one if he ever had the same distemper, if he knew any one who had it, if so, how he was cured?—*Family Herald.*

**GAS WORKS FOR WHOOPING-COUGH.**—The *Indianapolis News* of a late date says: For the past two or three weeks an average per day of forty or fifty persons having the whooping-cough visit the purifying room of the gas-work. It is claimed that a cure is effected by the person coming five or six times and staying ten or fifteen minutes each time. Relief is felt usually within a day.

**FROST-BITTEN LIMBS** should be immediately bathed in cold water, and rubbed until heat is restored. Avoid warming numbed hands and feet at the fire.

## Notices to Correspondents.

We have received a box of mineral specimens and fossils from Mr. A. J. Brown, which we have not yet had time to examine.

## Recent Mining Discoveries.

CALIFORNIA.—A ledge of silver-bearing quartz was discovered recently, in the field of E. M. Day, within the limits of the town of Lower Lake, in Lake county.

The recently reported coal discoveries in Capay Valley have been confirmed. Coal of a good quality has been found in several different localities.

UTAH.—Rich gold-bearing quartz has been found in Bingham Cañon. Assays of the ore have reached \$2,000 per ton. Considerable excitement in regard to these discoveries prevails in Salt Lake City, and a great number of people have gone out to the mines.

ARIZONA.—A mining excitement has broken out in Prescott, over the discovery of silver ledges in Groom's Basin, and on the divide between the basin and Upper Lynx creek. The mines are situated in a timbered district, southeast of Prescott. The Bismarck, Cornicopia and Homestake are among the richest ledges discovered. Some of the ore, which yielded \$1.25 per pound was taken into Prescott, and in consequence, a rush from that place commenced at once, and a number of claims were taken up the same day. Many employes from sawmills and stores joined the rush for the mines. Fine specimens of horn silver have been found.

LOWER CALIFORNIA.—Ledges of gold-bearing quartz have just been discovered on the frontiers of Lower California, and a party of 18 Mexicans from the Almaden Quicksilver mines left this city a few days ago, with their families, to work upon one of the mines.

## General Revival of Mining Interests.

The latest reports from the mining districts throughout the Pacific States and Territories, betoken a general revival in this branch of industry. This new and increasing interest in mining is caused by recent rich developments, which have been made; improved processes for reducing ore; and increased facilities of transportation to and from hitherto remote mining regions.

The extensive and valuable discoveries in the south and southwestern portions of Utah, and the eastern and southern districts of Nevada, have inspired a confidence and given an impetus to mining enterprises, such as has not been witnessed for several years past.

In Arizona, within the last few weeks, both gold and silver mines of extraordinary richness and extent have been found near Prescott, resulting in great excitement throughout the Territory. In Colorado, important developments have been made, and the yield of the mines is constantly and steadily increasing. Rich and extensive deposits of ore have also been struck in the Comstock Ledge recently. In California, several new enterprises have been inaugurated, by which gravel claims and placer mines heretofore abandoned, on account of water, will be drained and worked to advantage.

The stubborn ores of the Humboldt region, Eastern Nevada, and Arizona, which formerly resisted treatment, are easily reduced by new processes of roasting and smelting, and whole districts which had been neglected for years, are filled with miners, taking up old claims and locating new ones.

The completion of the trans-continental railroad and the construction of branch roads have penetrated and continue to penetrate regions, rich in mineral wealth, but hitherto so remote from all means of transportation, that there were no facilities for getting supplies or machinery, or shipping the ores. These heretofore inaccessible districts have become instinct with new life; provisions are obtained cheaply, and the richest ores can be despatched to reducing works, both east and west, and immediate returns received. The miners, who were in former times dependent upon capitalists entirely to develop their property and put up machinery, can now with the improved means of transportation, rely upon their own resources, and at a comparatively small expense send their ores to market. The completion of the Southern Pacific Railroad and the lines extending southward from Colorado and Utah will open up a region rich in mineral wealth.

The investment of European capital in productive mines is giving a stimulus to further enterprises, and assisting greatly in developing the resources of the country.

THE first number of Crofutt's *Western World* is before us, published by Geo. A. Crofutt, proprietor of Crofutt's trans-continental guide. It is devoted to the railroad and kindred interests of the great west; and to information for tourists, miners, and settlers this side of the Mississippi. The paper is a large one, bearing on its first page an engraving of unusual size entitled "Progress." We are pleased to see that Mr. Crofutt is still looking out for the interests of the Western States.

MR. O. W. EASTON, recently from Salt Lake, will deliver a lecture at Mercantile Library Hall, on next Monday evening. The subject is one of interest to all at the present time—Six months in Utah, its People, Institutions and Mines; Polygamy and its remedy. Mr. Easton merits a good audience, and we trust that he will have one.

GRADING on the Northern Pacific Railroad is now completed as far as the Red River.

## Tides and Currents of San Francisco Harbor.—Singular Facts.

It is well known that during the late civil war our friends at the South resorted largely to the use of torpedoes for the defense of their harbors, and by them were enabled to hold some of them, Charleston in particular, against the repeated attacks of our naval forces.

No less than nineteen armed vessels and transports were totally destroyed during the rebellion; many others were injured. Further, it is known that one of the first acts of France during the late war with Prussia was to fit out a formidable naval expedition accompanied by a land force, probably one of the most formidable naval expeditions ever set afloat, for the purpose of attacking the sea forts of Northern Prussia, and thus creating a diversion in favor of the proposed invasion of the South.

Following this there were no results affecting the prosperity of her arms; for, while the French fleet was getting ready, the Prussian harbors were being studded with torpedoes.

The French fleet arrived at its destination, reconnoitered, but no assault was made, nor was there one attempted.

Our Government profiting by these lessons, has instituted an examination of all our harbors, both on the Atlantic and the Pacific Coasts, in order to ascertain to what extent they may be defended by similar means in the future.

On inquiry of the proper authorities, we learn that Gen. Alexander, the Senior Engineer of the Army on this Coast, received orders, some months since, to have a series of Current Observations made in this harbor with the view of devising a system of torpedoes and floating obstructions as auxiliary means of defense in case of war with a maritime power.

He detailed Lieut. Handbury, U. S. Engineer Corps, on this duty, and the result of his labors is the development of some very remarkable facts, not hitherto known, concerning the Tidal Currents of this Bay, especially those between Fort Point and Lime Point.

We are not enabled to give in detail the results of these observations, but will lay before our readers some of the most prominent facts, trusting that they will be interesting to many.

The range of the tide at Fort Point from extreme high water to extreme low, spring-tides, is about eight feet. The duration of an ebb tide of this kind is about seven hours.

From calculations based upon these data, the velocities obtained from observations, the area of the cross section at the Golden Gate, and the area covered by the tidal waters that pass this point, it was found that approximately 110,000,000,000, cubic feet of water run out past Fort Point in seven hours.

This is equal to nearly one cubic mile of water, and is more than the amount which passes New Orleans in twenty-four hours during the highest known flood of the Mississippi River.

Supposing this water to have a mean velocity during this time of, say three miles per hour, the curious of our readers may find it interesting to determine the horse-power that it is equal to, and the number of steam engines that it could replace, provided its immense force could be utilized.

At the Golden Gate, observations were taken on the currents at the surface and at various depths down as low as three hundred feet below the surface. Their velocities and directions were very remarkable. The maximum velocity obtained was, for the surface current, 6.6 miles an hour, while that at the depth of 300 feet was running, at the same time, 10.5 miles an hour.

The currents at depths intermediate do not vary according to any known law between these rates, but are continually

changing their relation to each other, that is, for a considerable length of time the lower will be the faster, then they will change and strata intermediate between the surface and the lower, will have the greatest velocity. These changes in the velocities of the undercurrents seldom seem to affect that of the surface. This is always slower than any of the other currents, except perhaps the one in immediate contact with the bottom.

The directions of the currents are not always in the same vertical plane, but frequently they spread out like a fan, making various angles with each other. Near the time of a change of tide from ebb to flood, or from flood to ebb, it is not an unfrequent occurrence to find the surfaces running in one direction, and the lower current in a direction exactly opposite, with the currents at intermediate depths running in directions between.

The time of slack water is not, as is generally supposed, coincident with the time that the tide reaches its highest or lowest phase, but it occurs sometime later. This difference at the Golden Gate is an hour and a half or two hours. That is, after the tide has reached its highest point, has changed, and commenced to fall, the water continues to run in for an hour and a half, and when it has reached its lowest point, changed and commenced to rise, the water in like manner continues to run out.

Besides the observations taken between Fort Point and Lime Point there were many others taken at various places throughout the Bay and on the Bar, all of which have developed facts which are very curious and exceedingly interesting; not only on account of their connection with subjects of a purely scientific and military nature, but from their relation to the commercial wants of our harbor.

How far these current observations are regarded as favorable for the purpose for which they were instituted—that of defense—we did not learn. We imagine, however, that it would tax the ingenuity of our oldest pilots to anchor a system of torpedoes in the strong current of the Golden Gate, so as to have them in the right place at the right time. Doubtless they would have to be placed inside the entrance of the harbor in more quiet waters.

These are many questions besides the one of defense, but connected with our commercial prosperity, that render it exceedingly desirable that we should have a complete and reliable current chart of our system of inland waters, showing the directions and velocities of the currents throughout the Bay, at all the different stages of the tides. We hope to see such a chart at no distant day.

J. S. PHILLIPS'S NEW BOOK ON MINING, ETC.—This work is now printed and will be ready for distribution from the SCIENTIFIC PRESS office, Nov. 13th. Our English cotemporary, the *London Mining Journal*, the editor of which has perused some of the advance sheets, writes the following:

MINING LITERATURE.—A volume which promises to be of great value to practical miners, is at present preparing for publication, and will be ready for issue in the course of a few weeks, by Messrs. Dewey and Co., of San Francisco, under the title of the *Explorers', Miners', and Metallurgists' Companion*, by Mr. J. S. Phillips, who is well known to the readers of the *Mining Journal* as having had considerable experience in mining in Cornwall, and whose name in America is connected with the "Wee Pet" assaying machine, which, although capable of being packed for travelling in a 5 or 6-inch box, contains all the apparatus necessary for roasting, fusion, ignition, and all the general purposes of the analyst and assayer. Mr. Phillips's volume is divided into five sections. That treating of Geology and Mineralogy describes the formation of the earth, mineral veins, &c.; the supposed actions and re-actions that have been, and are continually, taking place; the peculiar characteristics of true fissure veins; and the more generally recognized premonitory indications, in the shallow portion of veins, for probable increase of mineral in depth. The second section teaches how to explore, where to explore, the peculiar kinds of the primitive and secondary rocks that concern the miner, as being most congenial for rich veins, &c. The remaining three sections are devoted to assaying and discriminations, mining and engineering, and metallurgy respectively. The volume will fill some 600 pages, more than three-fourths of which are already printed. Messrs. Trübner and Co., of Paternoster-Row, will supply the book in England, where it will, no doubt, find many readers.

## THE PHILOSOPHY OF GIFFARD'S INJECTOR.

EDS. PRESS:—Will you please explain the principle of Giffard's Injector in your columns and oblige.

G. W. W., Virginia City.

The Giffard Injector, as all know, is an instrument in which a jet of steam coming out of a boiler, and being condensed by a stream of water, surrounding and mingling with it, imparts to that water such force or velocity that it is able to enter the water space of the same boiler, notwithstanding the resistance of its internal pressure.

In its simplest form, it consists of the following parts, shown in the little cut which we have prepared to facilitate the description, and which shows simply the principle of the instrument, all details of construction being omitted: A nozzle, A, by which steam is admitted in the axis of the apparatus; around this an annular space, by which water from B flows in around the steam, and mingling with and condensing it in the conical tube, D, is driven through the pipe H, and valve, I, into the boiler. Excess of steam or water from want of adjustment escaping by the outlet, F, G, and G.

The action of this instrument seems, at first sight, to be discordant with certain principles, which are with good reason accepted as absolutely certain, and on this account its operations are difficult of comprehension. This apparent discord, however comes from an omission of certain

important conditions. At the outset then, the idea that a jet of steam escaping from a boiler, should be able to enter the same boiler again carrying with it an added quantity of water, seems to be in direct opposition to the general maxim, that the amount of a force can in no way be increased by the intervention of any sort of machinery.

The following consideration, however, will, to some extent, at least, remove this difficulty. If we suppose the reservoir of steam in the boiler to receive no addition of force or energy, it is clear that its elastic force or effective pressure will be reduced in proportion to the volume of steam withdrawn. If half its contents are removed, the pressure exerted by what remains will be reduced to half. On the other hand, if water, even at the full temperature of that in the boiler, is introduced, it will only increase the pressure in proportion to its volume. To restore the pressure of the boiler, diminished by withdrawing half its capacity of steam, the same amount or half its capacity of hot water, must be forced in. Now in the case of the injector, we know that nothing like this occurs. The steam escapes as steam, and is returned as water, with a volume reduced, say 1,000 times; and even if it carries with it twenty times its volume or weight of fresh water, there would still be a loss of pressure or effective force in the boiler, fully equivalent to the work performed in introducing the supply.

The force implied in expelling the steam, and therefore lost by the boiler, would thus clearly be a greater one than that restored by the introduction of the water. We have as it were, a rod or cylinder of steam, say 1,000 feet long, expelled with a given force or pressure from the boiler, and then by concentrating the force involved in this moving mass, we introduce against the same pressure a rod or cylinder of water, say twenty feet in length.

Clearly this does not imply any self-production or increase of force, but simply the concentration of an extended or diffused power into a condensed effect, as when a ship is pushed through the water by the action of the wind upon her sails. In short, steam pressure being well up in a boiler, if we damped the fire and started the injector we should soon run down the pressure to a point so low as to stop the action of the instrument, and this quite independently of the lower temperature of the injected water.

The first point to be apprehended in the special mode of action in this instrument is the difference between motion and pressure. Pressure is an isolated unit of force; motion, expressed by velocity, is the sum of many of these units.

Where a pressure exists without motion,

some force, instant by instant, is in action, but each instant its previous effort is counteracted and destroyed by whatever obstacle or resistance prevents motion from taking place, and keeps up the state of mere pressure. Thus no more power is at any time present in the bodies concerned, than that unit or single element evolved by the force in a single instant.

When, however, the resistance is wholly or in part removed, then the force produces a certain amount of motion in the body affected during the first instant, to which it adds in the second and third, and so on; the force thus being transformed into motion, and accumulated in that form in the moving body, so developing a constantly increasing velocity, proportioned to the time of action or number of force units involved.

Thus the particles of escaping steam may be regarded as acquiring velocity during the time that they are running from the boiler to the combining nozzle, and also while they are "closing up" by the process of condensation, and they then drive into the boiler again with this accumulated force, each portion encountering, not a similarly accumulated resistance, but only the momentary action of the opposing pressure at the instant of entrance.

This principle is well illustrated in the apparatus designed by M. E. Bourdon, to illustrate the relations which exist between velocity and pressure, in solid as well as fluid bodies. It consists of a cylinder, into which air is forced by means of a condensing pump, with a valve opening inwards on the end.

Immediately opposite this valve is placed another cylinder with an air gun attached,

CHENEY'S IMPROVED HORSE-POWER.

and which receives its air from the first cylinder by means of a tube, thus giving the same pressure in each. When these cylinders are charged the air gun is discharged and the ball will enter the first cylinder through the valve against a pressure exactly equal to that which developed its own motion.

The velocity of the ball expresses the sum of all the forces exerted by the air upon it during the many instants occupied in passing out of the barrel of the gun; the resistance of the valve is simply the single force of the air pressure, exerted for the instant required to open it.

Again; we may consider the action in another and quite different light. Let us suppose that the steam is issuing with the full velocity due to the pressure, from an orifice one inch in area. In the nozzle of the injector it is condensed into water, without, however, suffering any change in its velocity from this cause. Its bulk will be reduced by this means say 1,000 times, and therefore its area of cross section (the velocity being constant), will experience a similar reduction. Neglecting loss by friction, it would then be able to enter the boiler again by an orifice one one-thousandth of that by which it escaped, and we should thus have the total force expended by the steam within the boiler on the area of an inch in expelling the steam jet, concentrated upon the area of one one-thousandth of an inch, and therefore greatly superior to the opposing pressure exerted upon that small area.

If an additional quantity of water were taken up by the jet, as in the actual case of the injector, its velocity would be diminished in an equal proportion, and the area of inlet required for its passage increased in like amount to make up for its slower motion, and again in equal proportion by reason of the greater volume to be introduced; but we clearly have margin enough for both these deductions.

Thus, suppose 20 times the weight of the steam added to it in fresh water, thus

reducing its velocity to one-twentieth, and demanding an area of inlet increased 20 times for increased material; in place of 1,000 to 1, we should have the areas of escape and entrance, or the power and resistance as 1,000 to 20x20; or 400, or as 2½ to 1, which shows an abundant margin for loss by friction, etc.

It may occur to some that this reasoning looks like contradiction to the doctrine of hydrostatic equilibrium between large and small connected vessels, but a little thought will show where the distinction lies.

In a large and small vessel, the change of diameter in the different parts of the fluid is accomplished by the resistance of the sides of the vessel, and thus if the area is contracted, so also is the actuating force opposed and counteracted by the resistance of these opposing surfaces; but in this present case, the contraction of the jet is the result of no pressures externally applied, but of the internal inter-molecular contraction of the moving particles in condensing, which can, therefore, have no effect upon their actuating force. We are, therefore, fully warranted in assuming that the contraction of the jet by condensation is accompanied by a concentration of its moving force.

In this as well as in all other modes of explaining this instrument, we are brought back to the condensation in the nozzle, D, as the true cause of the development of power and of the effect produced. It will, therefore, be readily apprehended that if by reason of a high temperature in the feed water no condensation took place, the instrument could not work; while a temperature short of this would diminish,

cured so that its free end will be supported just above the tumbling-rod and below the screw-rod. If the screw-rod be turned so that the screw will force the end of the plate or spring down upon the tumbling-rod, which receives its motion from the master-wheel through a pinion at one or at both ends, it is easy to see that it serves as a brake to regulate the speed of the machine.

In order to apply a brake of the above described construction to a horse-power it is necessary to do it through the hub or standard of one of the wheels of the power so that it shall not interfere with any of the machinery, and it is evident that this brake can be applied through the hub of any of the wheels which are in the proper position with relation to the tumbling rods. As placed in the one represented in our cut it is convenient to the seat of the driver, who can thus regulate the speed of the machine or stop it entirely by a mere motion of the hand, in case there should be an unruly horse in the team or any accident happen.

This valuable and much-needed improvement was patented through the SCIENTIFIC PRESS agency by Return I. Cheney, of Petaluma, Sonoma county, Cal.

## PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING OCT. 31.

GOVERNOR FOR STEAM AND OTHER ENGINES.—Charles P. Bowen, Silver City, Idaho Ter.

WARDROBE.—Anna Davis, Reno, Nev.

GANG-PLow.—James M. Huie and Elisha Card, San Francisco, Cal.

GRAPE-CRUSHER.—Ferdinand B. Schoenlein and August Klein, San Francisco, Cal.

RAILWAY RAIL CHAIR.—Thomas Donahy, Empire City, Nev.

SPARK-ARRESTER FOR STEAM BOILERS.—John Gates, Portland, Oregon.

MILLING MACHINE.—Wm. Hawkins, San Francisco, Cal.

FRICTION CLUTCH.—George W. Hedges, San Francisco, Cal.

APPARATUS FOR LIGHTING GAS BY ELECTRICITY.—John Vansant, San Francisco, Cal.

COMBINED TENT AND COt.—Wm. H. Penrose, Fort Lyon, Col. Ter. Antedated Sept. 30, 1871.

ADJUSTABLE RAIL-JOINT.—John R. Sullivan, Woodland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible by telegraph or otherwise at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

DESTRUCTION OF THE ARCTIC FLEET.—We have news the past week of the almost total annihilation of the Arctic whaling fleet. Over thirty vessels have been crushed and destroyed or so hemmed in by the ice as to compel their abandonment, involving a loss of two millions of dollars, the most of which was insured. We appear to have truly fallen upon an era of calamities.

OUR NOTICE concerning the agency of T. W. Drullard, recently, resulted from a series of accidental and unaccountable delays. Mr. D. has proved an honorable and active agent, and will continue on our list of those whom we heartily recommend to the consideration of our friends.

BEQUEST TO THE DEAF AND DUMB ASYLUM.—R. W. Durham, of Chico, recently deceased, left property to the State Deaf and Dumb Asylum valued at about \$100,000.

LAURA D. FAIR has sought solace in prison by dramatizing Owen Meredith's poem, "Lucille."

## DOMESTIC ECONOMY.

### Household Economy.

EDS. PRESS:—I always have a great many things to find fault with, too many perhaps; but the complaints I am about to set before you, concern everybody, and if everybody would combine to put down the impositions they relate to, they will easily be remedied, and for health and happiness, should be. Let me premise that I keep five scrap books; one poetical and miscellaneous, one cook book, one medical, one agricultural and one for comments, prints, etc.; that few—not speaking of my book for engravings, and the one for newspaper prints worth preserving. Now, when scissors in hand, I lie down to rest with a paper, and it furnishes me with nothing worth scissoring for either of these, no matter what exciting serial or political problem it may contain, I throw it aside with disgust; but I have a different complaint to make of your paper, and yet it is not one of the evils that I should like to see remedied. My complaint is that if I want to slip out a long receipt, that I think I could now easily refer to in one of my books, I can't cut it out because I invariably discover something valuable on the other side, that I can't destroy. I think I shall have to take two papers, one to file, the other to sacrifice to scrap books. All this introduces a scrip I send you, cut from some paper, which you can publish again if you see fit. It is about the narrowness of boot soles, and it is correct in its statements.

I have also seen articles on the injury which high heels do the foot and leg. A person with a moderately high instep cannot get a boot that will not be an unwearable torture, without buying a pair a size too large every other way; and then the heels are put on with nails which wear out the stocking and excoriate the heel, and which hammering down don't cure. I cut up old hats into soles, and until the nails come through them, am easy.

Why all this torture? Cannot shoemakers learn to make wearable shoes, such as they did years ago? But in vain do I entreat the best San Francisco artists in leather, to please make my shoes *broad enough and large enough*, and with high insteps.

Not a thing to walk out in, while boots lie all around. I sometimes sit and calculate which of the different tortures will be most endurable for the day—Oh! shoemakers, if ye have souls to feel, I pray you consider ours.

COMPLAINT 2D:—Let any housekeeper find an old yeast powder box obtained in years ago—one that she has put by, perhaps with seeds in it or other trifles, and endeavor to put upon it the cover of one of the present or two last years, and she will find *it can't be done*. In fact the boxes are a size smaller—Why? To pay for stamps, I suppose; but the yeast powders are dear enough without that. They become quite an item in the month's expenditure. Can't this imposition be rectified? If not—Why?

TAPIOCA is recommended as a cheaper and more nutritious article of food than even potatoes and rice, by no less a personage than the Prince of Travancore, the southernmost province of Hindostan. The cultivation of the manioc plant, from the root of which tapioca is made, as starch is from potatoes, is rapidly extending in the province. Its advantages are that it grows in almost any soil, requiring but little labor, and after the first month but little moisture. It is very productive, and is easily prepared for consumption. The Indian government have taken measures to test the merits of the plant; but as the food it yields is almost exclusively of the starchy or fat-producing character, and contributes little or nothing to the formation of muscle, it is difficult to see what benefit would be derived from increasing its use.

HARD AND SOFT WATER.—An attentive correspondent has just sent us, for this department, a very practical article in regard to softening water for domestic use, which we shall publish next week.

TO MAKE GRAVY THAT WILL KEEP SEVERAL DAYS.—Lay in a stew-pan or suitable vessel half a pound of lean, juicy, fresh meat of the poorest pieces or trimmings; over this put half a pound of pickled pork, or a little less bacon of the side meat. Cut up 2 medium-sized onions and a few sprigs of parsley. Pour into the vessel a tumblerful of boiling water (not more than this); cover the vessel, and let the meat stew, turning it once, until it is a rich brown color; then pour in boiling water enough to just cover it; let it simmer an hour; remove the meat; thicken the gravy slightly with a paste made of brown flour and water; let that simmer half an hour; add any essence of ham or good gravy that may be saved for such purposes. Put in an earthen vessel well covered, and exclude from the air. Warm it before serving; season with any catsup liked. For making all brown gravies, fry the meat first, and pour over hot broth, gravy or water; use the browned sugar or flour for coloring and thickening. Kidneys, livers, necks of poultry, the soraggy parts of the necks of animals, may be used for making the stock for gravy.

PENNYROYAL FOR FLEAS.—The oil of pennyroyal will drive these insects off; but a cheaper method, where the herb flourishes, is to throw your dogs and cats into a decoction of it once a week. Mow the herb, and scatter it in beds of pigs once a month. I have seen this done for many years in succession. Where the herb cannot be got, the oil may be procured. In this case, saturate strings with it, and tie them around the necks of dogs and cats; pour a little on the back and about the ears of hogs, which you can do while they are feeding, without touching them.

By repeating this application every 12 or 15 days, the fleas will flee from your quadrupeds, to their relief and improvement, and your relief and comfort in the house. Strings saturated with the oil of pennyroyal, and tied around the necks and tails of horses, will drive off lice; the strings should be saturated once a day.—*Scientific American*.

BOTTLING APPLES.—If you have a quantity of empty self-sealing bottles, and you wish to prepare a large quantity of apple sauce and to have it until spring, an excellent way is to bottle it. Prepare the sauce according to whatever rule you wish; then, when boiling-hot, pour into the bottles and put on the covers immediately. Apple sauces prepared now and bottled will have more flavor than that made in the spring of the year.

A SUBSTITUTE FOR COFFEE.—From chemical analysis it appears that the seed of the asparagus when dried, parched and ground makes a full flavored coffee, but little inferior to Mocha, containing in common with tea, and coffee, the principle called tannin. Dry the asparagus berries well, after being thoroughly ripened, then rub them on a sieve; thus the seeds are readily separated.—*Journal of Health*.

TAKING CARE OF BROOMS.—Have a screw with an eye or ring on its end; this can be screwed into the end of the handle of each new broom. It is handier to hang up by than a string, though the latter will do if always used. It is bad for a broom to leave it standing upon the brush. If not hung up, always set it away with the stick end down.

INDELIBLE INK.—By placing a piece of caustic in the end of a quill, and whittling the side to a point, any cloth, being first slightly damp with water, may be written on so indelibly that no art can remove the color.

PROTECTION FROM DAMP WALLS.—Boil one pound of powdered sulphur in two quarts of water for half an hour. Apply with a brush while still warm, and you will prevent the damp and unwholesome oozings from the brick walls of your workshops.

WATERY POTATOES.—If your potatoes are watery, put a piece of lime about as large as a hen's egg in the pot, and boil with them, and they will come out as mealy as you please.

If brooms are wet in boiling suds once a week, they become very tough, will not cut the carpet, last much longer, and always sweep like a new broom.

TO CLEAN LAMP-SHADES.—Lamp-shades may be cleaned with soap or pearlash; these will not injure or discolor them.

FRIED SQUASH.—Slice thin, dip in egg, then in flour, and fry in butter. Excellent.

### Domestic Receipts.

To remove egg stains from silver, rub with table salt.

CHAMPAGNE CIDER.—To 35 gallons of good cider put one gallon of strained honey, or eight pounds of good white sugar; stir them up well and set aside for a week. Clarify the cider with one quart of skimmed milk or six ounces of dissolved gelatine, and add five quarts of pure spirits. After two or three days bottle the clear cider, and it will become sparkling.

HOW TO DEODORIZE OIL.—You may deodorize any oil by shaking it with a weak solution of bleaching powder which has been previously acidulated with hydrochloric acid. This is best done in a large bottle, into which oil and lye are introduced, the bottle stopped and now and then shaken. After two or three days pour off the oil and wash it several times with water, when it will have lost its unpleasant odor.

PEACH-LEAF YEAST.—One of our Southern exchanges gives the following recipe: Take three handfuls of peach-leaves, and three medium sized potatoes; boil them in two quarts of water until the potatoes are done; then take out the leaves and throw them away; peel the potatoes, and rub them up with a pint of flour, adding sufficient cool water to make a paste. Then pour on the hot peach-leaf tea, and scald for about five minutes. If you add to this a little old yeast, it will be ready for use in three hours; if you add none, it will require to stand a day and a night before use. Leaves dried in the shade are as good as fresh ones. As this is stronger than hop-yeast, less should be used in bread-making.

WELCH RABBIT.—Put into a frying-pan a quarter of a pound of cheese cut up into thin slices. Pour on it half a pint of sweet milk. Stir in an egg that was already beaten up, add a fourth of a teaspoonful of mustard, a little less red pepper, already ground, and a teaspoonful of nice butter. Stir this mixture all the time. Then add, lastly, a few crackers well broken up, and after thoroughly incorporating them into the mixture, turn it all into a heated dish and cover it.

### Mechanical Hints.

CAST STEEL that has been burnt or spoiled by overheating can be partially restored by heating it over and quenching in water four or five times, each of less extent than the first overheating and decreasing; lastly, hammering the steel till nearly cold, to give the greatest condensation before hardening. Some prefer the steel thus recovered for cutting-tools, and the treatment really produces a remarkable change, as a fragment of the same bar in the spoiled state will be extremely coarse, and another of the restoration as extremely fine.

CLEANING WINDOW PANES.—Housewives sometimes are very much surprised at their inability to remove the smoky and stained appearance from their window panes. Glass is often changed by a very short exposure to the weather. Sunshine and rain alone, will effect a most marked change in certain (soft) kinds of glass. When a little soda will not remove the stains, the only way to remedy the trouble is to buy new glass.

CLEANING POLISHED BRASS.—The first requisite is to remove all grease. This may be done with a solution of concentrated lye, and fine pumice or rotten stone. A weak solution of muriatic acid and clean scouring dust will then brighten it, after which it may be oiled, with olive or cocoa nut oil. Vinegar and common salt may be used instead of the acid. Weak vegetable acids are preferable on fine work, and vegetable oils better than animal fats.

ANOTHER METHOD.—Take eight parts water, and one part muriatic acid; mix them, and put in common water lime, until the mixture is thicker than water. Shake up well before using. Pour some on a rag, and put on the brass. Let it stay a minute or two and then rub. It will clean the dirtiest brass more quickly and better than anything else, so says a correspondent of the *Scientific American*.

IMITATION WALNUT is made by washing butternut-wood with lime-water and then varnishing. Lime-water will also stain cherry-wood to a good imitation of mahogany.

REFINED OIL FOR MECHANISM can be prepared by putting zinc and lead shavings, in equal parts, into good Florence olive oil and placing it in a cool place till the oil becomes colorless.

## LIFE THOUGHTS.

BORROWED garments seldom fit well.

HASTE often trips up its own heels.

A FOOL generally loses his estate before he finds his folly.

A MAN that hoards his riches, and enjoys them not, is like an ass that carries gold and eats thistles.

TOWERS are measured by their shadows and great men by their calumniators.

TRUE courage and love are the syllables of faith.

THE chains of habit are generally too small to be felt till they are too strong to be broken.

THERE is an efficacy in calmness of which we are unaware. The element of serenity is one which we peculiarly need.

If good people would but make goodness agreeable, and smile instead of frowning, in their virtue, how many would they win to the good cause.

THINKERS are as scarce as gold; but he whose thoughts embraces all his objects, pursues it unwearyedly, and fearless of the consequences, is a diamond of enormous size.

EVERY desire bears its death in every gratification. Curiosity languishes under stimulants, and novelties cease to excite surprise until at length we cannot even wonder at a miracle.

WHAT a world of gossip would be prevented if it was only remembered that a person who tells you of the faults of others intends to tell others of your faults.

OBSCURITY leaves a man free, but a famous man is a slave to his fame. Incense is bought dear. Uneasy lies the head that wears a crown, although the crown may be of laurels.

### The Influence of Example.

Men's lives are pages of history. Those who read are stimulated to good deeds thereby, or taught to avoid the mistakes such lives record. There cannot be too much said, or written, to encourage men of wealth to devote their leisure and money toward developing the hearty in Nature, recovering and regenerating waste places, and affording men with less means and opportunities for the study of rural art. The influence of an example of good taste in the adornment of a single place in a neighborhood or town, reaches far into the future and molds more than most men think, the external features of that neighborhood or town, and affects more ultimately the lives of those whom it influences. If one man plants a tree his neighbor wants one. If one housewife has a flower *parterre*, another is not insensible to the enthusiasm with which the first exhibits and praises her floral pets. If one man sees his neighbor clearing out an old swamp, a ravine, or a rough place of any sort, and converting its rude angularities into symmetrical lines of beauty, he ever after looks upon the rough places of his own domain with the possibilities of what it may become in his mind's eye, and realizes, sooner or later, the ideal beauty which the realizations of his neighbors have established.

BE A MAN.—Foolish spending is the father of poverty. Do not be ashamed of work nor hard work. Work for the salary or wages you can get, work for half price rather than be idle. Be your own master, and do not let society swallow up your individuality—hat, coat and boots. Do not eat up or wear out all that you earn. Compel your selfish body to spare something for profits saved. Be stingy to your own appetite, be merciful to other's necessities. Help others and ask no help for yourself. See that you are proud. Be too proud to be lazy; too proud to give up without conquering every difficulty; too proud to be in company that you cannot keep up with in expenses; too proud to be stingy.

THE study of the magnet is one of un-failing interest to grown people as well as to children, and it is a matter of surprise that so little attention is given to so profitable a subject. We can find nothing that teaches so forcibly of Christ and his influence upon the soul—nothing that could more thoroughly convince a skeptic of his ignorance and folly.

If half the pains were taken by some people to perform the labor allotted them that are taken by them to avoid it, we should hear much less said about the troubles of life, and see much more actually completed.

THE WATER QUESTION.

By A. B. BOWERS, CIVIL ENGINEER.

[Continued.]

Swamp Land Basin, North of the American River.

On the east side of the Sacramento, above its junction with the American, is a basin forming part of several townships, many thousand acres of which are lower than the banks of either streams. This basin receives the drainage of a considerable area on the east, and its reclamation involves therefore, the leveeing of the rivers, the disposal of the drainage, and the irrigation of the land. The most judicious drainage and irrigation, can be determined only after the necessary surveys have been made. It will perhaps be found advisable to carry portions of the drainage into each river, though it may be necessary to carry the whole of it either under, or over the American. The catchment drains should be so located and constructed, as to furnish facilities for the irrigation, not only of the swamp land, but of the adjacent uplands also; and the drainage water should be stored up in reservoirs for this purpose, wherever an opportunity presents itself.

The rainfall within this basin, would probably be absorbed by the soil, though in very wet winters, some pumping might be necessary; but, if so, it would not be sufficient to occasion any great expense.

Other Basins.

Similar conditions are met with in the basins on the west side of the Sacramento, both north and south of Knights Landing, and in that between the Sacramento and Feather rivers; and similar measures, of course, are necessary for their reclamation.

Basins on West Side of Lower Sacramento.

On the west side of the lower Sacramento, extending for several miles on either side of the southern boundary of Yolo, is a basin, lower, in places, than the level of the ocean; and these portions are always covered with water; the evaporation of a single season, being insufficient to dispose of it all, though it probably carries off five or six feet per annum.

Yolo Basin.

North of this basin, perhaps eight or ten miles below the city of Sacramento, a transverse swell, probably not more than three or four feet above the land on either side, crosses the tule from upland to river. The highest part of this swell, is supposed to lie a little north of the old turnpike, known as "The Swift Grade." North of this swell extending to near where the California Pacific Railroad crosses the tules, and perhaps a mile or two farther, is another basin lying wholly in the county of Yolo, so shallow that the water quickly evaporates whenever it ceases to be fed from Putah and Cache creeks.

Regulation of Drainage.

Through these two basins, according to the best maps within our reach, passes the drainage of about twenty-five hundred square miles, or one million six hundred thousand square acres; embracing the whole, apparently, of Lake county, nearly all of Yolo, and a large portion of Napa. By the construction of the necessary levees, reservoirs, dams, and canals, this drainage may be regulated so as to furnish irrigation for swamp land and upland; and the arable portion of this region may thus be made a perfect garden in fertility and productivity. Should it be found impracticable to construct reservoirs of sufficient capacity, in connection with canals of irrigation to retain all the waters of Putah and Cache Creeks, the surplus can be carried between suitable embankments to some of the head branches of Cache Slough. This, however, is not likely to prove necessary. When this drainage has been disposed of, and the proper levees constructed, the deeper portions of the lower basin, will soon become dry from evaporation, unless large springs, or waters of filtration, should necessitate pumping. This, however, is not probable, and, if necessary, would occasion no great expense.

[To be concluded.]

Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

PROPOSALS FOR BUILDING THE FOUNDATION WALLS OF THE NEW CITY HALL BUILDING, AND ALSO, FOR FURNISHING CEMENT AND BRICK TO BE USED IN THE SAME.

OFFICE OF THE BOARD OF CITY HALL COMMISSIONERS, SAN FRANCISCO, OCTOBER 13th, 1871.

Sealed proposals will be received at the office of the Board, on the City Hall Reservation, corner of McAllister and Leavenworth streets, until 12 o'clock M. of SATURDAY, the 18th day of November, A. D. 1871, for building the foundation and cross walls of the City Hall Building and Hall of Records, and for all the accessory work belonging thereto, in conformity with and according to the plans and specifications, which can be seen at the office of the Architect, Augustus Laver, in this same building, and where all information as to the details of the work can be obtained.

The whole amount of mason work will be about 20,000 cubic yards.

Proposals will state the price per cubic yard for the mason work laid and measured in the wall, completed in conformity with the plans and specifications, and the price per thousand for laying the brick for the jambs, flues, drains, etc., required in the foundation.

Separate proposals will be received at the same time and place for furnishing the following material:

1,000,000 (one million) good, smooth, hard burnt BRICK.

Both Cement and Brick to be delivered on the ground as required.

The whole work is to be done in a thoroughly workmanlike manner, under the immediate direction and superintendence of the Architect and to his satisfaction, and completed in (20) one hundred and twenty working days from the date of the signing of the contract, and the Cement and Brick are to be delivered in the same time, as required.

The Commissioners reserve the right to reject any and all bids.

Parties making proposals for the mason work will be required to give a good and sufficient bond, to accompany the bid, satisfactory to the Commissioners, in the sum of \$5,000, conditioned for the due entering into the contract of the party to whom it may be awarded, and parties making proposals for the brick and cement will be required to furnish with their bids a like bond in the sum of \$2,500 respectively.

To preserve uniformity, all bids must be on blanks furnished by the Board of Commissioners, which can be obtained from the Secretary at their office.

No bidder will be allowed to deposit more than one bid for the work, and if more than one appear at the opening of the bids, all the bids of such bidders shall be thrown out. The statute provides "that all bids shall be made and contracts entered into upon the express condition that no Chinaman or Mongolian shall be used in the factory, mill, foundry, workshop, or by the firm, company, or person, in doing any of the work bid or contracted for; and a failure to comply with said provision of said contract shall work a forfeiture of said contract."

Payments will be made from time to time of seventy-five per cent. of the estimated amount of the work done and material delivered, and the remaining twenty-five per cent. when the contract is fully and faithfully completed, in warrants drawn on the Treasurer of the City and County of San Francisco, on the City Hall Fund, which warrants, when there are no funds to the credit of said City Hall Fund, will bear 10 per cent. per annum interest from the date of the presentation thereof until paid, and will be paid in the order of their presentation and registration. The expense of advertising will be charged pro rata to the successful bidders.

P. H. CANAVAN,  
JOS. G. EASTLAND,  
CHAS. E. McLANE,  
Board of City Hall Commissioners.

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, label, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see names on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester; Grosche and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & SO., San Francisco. 1v23-1y50c

Repairing done on very Reasonable Terms and in the best manner. No. 32 Fremont street, S. F. 1v23-3m

The Best Bedstead Fastening!

BARLOW'S PATENT, 1871.

Repair Your Bedsteads!

By employing this new California invention, which is bound to supersede all other fastenings.

They are made of Wrought Iron, by machinery, and are easily applied, quickly operate (as may be seen by the above illustration), and never break or wear out. Don't bother any longer with rickety bedsteads, but buy these fastenings and apply them yourself, or send to the inventor, who will repair any kinds of bedsteads at reasonable rates. Examine this patent device, and with the best workmen in the city, you will declare it to be the best and only perfect Fastening.

Orders received at my shop, corner of Sixteenth and Harrison streets, or at 320 Kearny street, Room 5.

This device is just what its name indicates. As a KITCHEN Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &amp;c., &amp;c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 2v21-ct

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Oam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

CRAIG & BREVOORT'S  
Patent Condenser for Steam  
PUMPS, &c.

NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT, 6v23eowly 128 Broadway, New York City

THE PATENT  
Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ore, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 18, 1871.

VOLUME XXIII.  
Number 20.

## Standard Stationary Steam Engine.

Our engraving represents one of the 10x20 Standard Stationary Steam Engines made by Lane & Bodley, Cincinnati, Ohio, which is of a very neat pattern and convenient size. It is built on a solid iron frame, the centers of the cylinder and main shaft coinciding with its upper surface, the slides resting solidly upon it, and the rock shaft stands short and stiff—all matters of the first importance as bringing the strain resulting from the working of the engine in that position where the strength of the metal can most successfully resist it.

The cylinder is provided with metallic packing, and the heads have ground joints; the valve is set and provision made that its position cannot be lost when taken apart for shipment; the slides are double, as in locomotives, the cross-head working between them; the connecting rod is of wrought-iron and fitted up in the best manner; the main plumb block is bedded down into the frame and is provided with side brasses and adjusting wedges; the main shaft is of wrought iron and of such length that the band wheel may be put outside or inside the journal as is most convenient. The exhaust steam from the cylinder passes through the heater, within which is a core of wrought iron pipe, entering and issuing at opposite ends thereof. The crank is accurately balanced, steam and exhaust ports of ample dimensions, and the valve movement combines all the advantages of expansion cushioning and lead.

The pumps may be attached to the bed of the engine, provision being made for operating them at high speed, or they are designed for independent action as desired. In either case the lift pump discharges into a short vertical pipe, connected at its lower end with the receiving valve of the force pump, having a cock to regulate the flow of water thereto, and an iron vessel holding several gallons, with an overflow at its side, screwed upon its upper end. Cold water is thus supplied to the force pump by gravity, and the surplus is permitted to flow back to its source. If the construction of an elevated tank be afterwards determined upon, the funnel may be removed and the pipe continued and inserted in the tank near its bottom. The force pump fed with cold water never gives any trouble, and the water is afterwards heated in its passage through the coil within the heater, nearly, if not quite, to the point of ebullition.

For further information concerning this engine address Lane & Bodley, corner of John and Water streets, Cincinnati, Ohio.

## Spontaneous Combustion.

May not the late destruction of the schoolhouse in Binghampton, Solano county, and the Harpending block in this city, both be attributed to spontaneous combustion?

Our attentive Binghampton correspondent, R. H. Barkway, asks for some information about "spontaneous combustion," the immediate cause of the query being in consequence of the recent destruction, by fire, of the Binghampton schoolhouse, whereby a loss of some \$1,200 was incurred. There had been no fire in the house for a week, and we infer that spontaneous combustion is suspected as the origin of the fire from the following paragraph in the note of our correspondent:—

"Will woolen or cotton cloth or rags

of various kinds would be likely to be brought together under precisely the conditions which the Detroit experiments prove may cause self-ignition.

We have no doubt that many fires, the causes of which have been reported unknown have originated in the manner above indicated; and it is a matter of no little surprise that our insurance companies and citizens generally, do not pay more attention to the matter, and devise some means, either by spreading more widely the necessary information on the subject, or in some other way seek to avoid the danger referred to. The newspapers of the country by publishing, with comments, the article referred to on page 311, might do much good in this direction.

## Fog Horns and Whistles.

Five steam fog whistles, and two steam fog horns are now being fitted up, at the

## On One of the Causes of Loss of Quick-silver in Amalgamation of Silver.

[Written for the Press.]

The problem of amalgamating silver ores, consists essentially, in every process, in the reduction of the silver from the compound to the simple state, and bringing it, in that condition, in contact with mercury.

The ore, however, finely crushed, remains in the form of particles, of various, but sensible magnitude. These particles may consist, either wholly of silver, or other metal compound, or, partly of that, and partly of earthy matter, quartz, etc.

In some amalgamation processes, other metals besides silver, notably copper and lead, are reduced to a greater or less extent. This applies particularly to iron pans and "base ores." When the reduction of the metal compound, contained in the particle of ore, is partial, and incomplete, a certain quantity of mercury adheres to that particle, by reason of a film of reduced metal on its surface, and causes one or two results: either the particle of imperfectly reduced ore is carried into the mass of amalgam, or, the adhering quicksilver is carried into the tail race. This will depend on the extent of the amalgamated surface.

When unreduced ore is thus carried into the amalgam, it causes trouble in retorting and melting, and accounts for the phenomenon, mentioned by Mr. Küstel in his first book of amalgam, which feels crisp, and appears pure, yet, on retorting, is found to be dirty. In the other case the quicksilver is lost. It may often be detected in the tailings, by washing a portion of them in a pan; a greyish heavy residue is obtained, which by rubbing in the palm of the hand, with clean water, yields a pellet of amalgam, while sand is separated. From the visible we may infer the invisible, and doubtless a great part of the loss is due to this cause.

The loss is greater in working "base ores" than in treating those which are purer. This is because the means used to reduce the silver compounds also reduce copper and lead compounds, but the reduction is never complete, nor, in regard to the base metals, is it desirable that it should be so.

The remedy for this difficulty is indicated by the cause, and consists:

First. In regard to the purer ores; in the more perfect reduction of the silver, better washing of the tailings with plenty of clean water, and the use of concentrators, by which the amalgamated particles may be saved for re-treatment.

Second. In the case of "base ores," whether roasted or not, in addition to the foregoing precaution, in avoiding the use of iron as a reducing agent, and substituting copper therefor.

O. H. A.

MINERS, write for the Press.

STANDARD STATIONARY STEAM ENGINE.

saturated with linseed oil though small and only three pieces, ignite, if thrown together in a room. If so, how many hours might it take and under what conditions?"

In reply, we would refer to an article under the head of "Useful Information," on page 311 of the present issue, which was in print before we received our correspondent's note, and from which it will be perceived that spontaneous combustion, under such circumstances, may take place.

The phenomena connected with spontaneous combustion seem to be pretty well understood, and might be easily prevented if persons entrusted with commodities liable to self-ignition would only carefully attend to their business. The destruction of the Liverpool trader, Red Jacket, of 1,463 tons, on her way from New Zealand with a cargo of wool, at the time drew the marked attention of the English public to the liability of that article, under favorable circumstances to ignite spontaneously. The loss in that instance was some \$1,000,000.

We have thought from the first that the late fire in this city which destroyed the Harpending Block, involving a loss of \$1,000,000, was the result of spontaneous combustion. If we mistake not, the fire was first discovered at a locality in the block where linseed oil and cotton waste

boiler works of McAfee, Spiers & Co., in this city, and will soon be put up at different points along the coast, under the supervision of Col. R. S. Williamson, of the 12th Light House District. The whistles and engines were made in the East, and the boilers are attached here. The whistles will be erected at Point Reyes, Point Arena, Pigeon Point, Point Anno Nueva and Point Concepcion; and both fog horns at Point Bonita. The whistle at Point Reyes, is waiting for the advent of the rainy season, that at Point Arena is almost completed, that on Pigeon Point is already in operation; the machinery for the one at Point Anno Nueva is at the works ready for shipment, and the one for Point Concepcion is already on the ground, and will be erected immediately. These steam whistles are a new invention and are being generally adopted in the United States and Europe. The trumpets of the fog horns, or sirens, to be placed on Point Bonita, are 18 or 20 feet long, and will be heard for miles.

During the number of years which have elapsed since the settlement of this coast by a white population, and the consequent permanence of the shipping interest, only one vessel or steamer, (the Continental) has been lost by "stress of weather." Of the other casualties in this line the majority were caused by the prevalence of fogs, or miscalculation in position when entering this port; consequently these fog horns and whistles will be of great advantages in preventing such accidents hereafter,

## MECHANICAL PROGRESS.

### A Most Important Discovery—if True.

The Portland *Dispatch*, in a late issue, gives the details of a most important discovery, if the statements of that journal can be relied upon. The discovery or invention has been made by Mr. Robert Spear, and consists in a simple device, whereby it is claimed that compressed air can be forced through tubes any required distance without any sensible loss by friction. The importance of such a discovery can scarcely be over-estimated even by an imagination allowed the freest flight. It would bring cheap power to many workshops and households, as gas and water are now brought. Automatic machinery, worked by tidal forces, might supply any city on the sea coast. A waterfall might furnish the whole region about it with a cheap power for workshops.

To the miners of California such a result would be of incalculable importance, in reducing the cost of ventilation by forcing air through tubes, and in conveying power to drilling machines, which must soon be very generally introduced into tunneling operations.

The device whereby it is claimed all this can be effected consists, as described by the *Dispatch*, as follows:—

"The invention consists in the discovery that while in tubes of uniform size, fluids in their passage gradually lose their force and velocity, by making at short intervals peculiar contractions in the pipe, the original power is transmitted without loss—absolutely without loss. By using colored fluids in glass tubes provided with Spear's invention, it is demonstrated that the propelled current is kept in the center of the tube without any friction at the sides.

"If by a diaphragm pierced with holes at the sides, this current is forced to divide and seek passage next the inner surface of the pipe, it at once resumes its course in the center after the obstruction is passed.

"He has also discovered that while any angle or bend in an ordinary pipe obstructs a fluid flowing through, by enlarging the pipe at angles, the friction and loss of power is overcome. At Mont Cenis and at the Hoosac Tunnel it has been found necessary to greatly enlarge the whole conducting pipe for every mile of distance the compressed air has to be forced. This, of course, seriously increased the expense. Mr. Spear's invention greatly reduces the size of conduit necessary for long distances."

To show the practical value of the invention, pipes constructed with his device have been connected with an 8-horse power steam engine, in Portland, by which it is claimed the power is conducted 480 feet much cheaper than steam can be conducted in the ordinary manner—30 pounds initial pressure of air doing the same work that requires 40 pounds steam pressure.

The value of the above alleged invention might easily be tested at almost any locality, where a steam pump or other air compressing machinery can be had. While it is possible that there may be something in it, the claim set up that all friction in the passage of air or water through pipes is thereby overcome, and power transmitted "absolutely without loss," is of course preposterous.

**WROUGHT IRON TIES.**—According to the English scientific journals wrought iron ties are regarded with especial favor by many practical railroad builders of large experience, especially for use in tropical countries. The ties most popular are composed of a number of webs and plates of rolled iron riveted together and pierced with bolt holes for the chairs. The first cost of these ties is found not to exceed the cost of the best wooden ties by more than one shilling each, and this is more than compensated by their greater durability and the saving in the expense of laying them, as compared with wood. They are also considered safer, as enabling the rails to be much more firmly secured than if spiked down to wooden ties. Properly coated they may not only be protected against rust, but they are proof against insects and worms, to the ravages of which wooden ties are much exposed in India and other tropical climates. It is not likely that their use in northern latitudes would be attended with economy at the present time, but the time is not far distant in this country when the supply of wood available for ties will be so far reduced to make their cost nearly, if not quite, as great as that of iron ties, and the experiments now in progress in India have an interest for railroad builders in this country greater than would at first appear.

**ADJUSTABLE CAR AXLES.**—A diversity of one, two or more inches in the gauge of connecting roads of course involves the necessity of breaking bulk, an annoying and expensive operation not unattended with profitless delay. To obviate this, the most obvious means consists in so constructing the truck axles of the cars that the wheels may be readily adjusted at different distances apart. This plan has been tried in a number of instances and abandoned as impracticable. In some cases where the necessity was urgent the gauge of the connecting railroad has been changed, so as to present the desired uniformity. In other cases, at least in Europe if not in the United States, trucks of different gauge, capable of replacement, have been substituted for the adjustable axle.

It is still thought, however, by many good engineers, that the mechanical difficulties which have hitherto rendered adjustable axles impracticable, might, and should be, overcome, inasmuch as such axles certainly afford a much more feasible, cheap, and, in the end, efficient means of accommodating cars to change of gauge than the clumsy resource of interchangeable trucks. If the adjustable axles are not yet what they should be, let them be made so, for the system, properly applied, has too much utility in it to be profitably thrown away. An opportunity is here presented for the profitable exercise of the skill of some of our best inventors.

**A VALUABLE TIMBER FOR PILES.**—THE JARRAH OF AUSTRALIA.—A great deal of discussion has taken place during the last twelve months relative to the durability of the jarrah timber of Western Australia, but until the present time no positive proof has been given to residents in Melbourne of its good qualities. There are, however, at present on view at the Flinders street station of the M. and H. B. Railway Company there, three logs of jarrah timber which have, for the last thirty years, formed a portion of the jetty at Perth, Swan River, Western Australia. They have been drawn by the government and forwarded to Melbourne with a view of exhibiting the capabilities of this wood. The logs are about 20 feet in length, with a diameter of about 12 inches, and, having been sawn down the full length and polished, exhibit the splendid grain of the wood to great advantage. The wood, it appears, is as firm and solid as when first hewn. The grain is close, of a fine dark color, and takes a rich polish.—*Builder.*

**PREVENTION OF CALCAREOUS BOILER INCORUSTATION.**—A very simple mode of preventing boiler incrustation is in general use at Darmstadt Gas Works. The engine has worked night and day since 1854, almost without interruption, and the formation of calcareous deposits has been prevented by the use of crude pyroligneous acid, combined with tar; it is either introduced into the boiler or mixed with the feed water. Since the mixture has been in use they have never had to use a hammer to remove scale. Each year during the summer, when less gas is required, the boiler is opened, and perhaps a couple of handfuls of loose sediment taken from the bottom. The quantity employed is very small—just enough to redden litmus paper; consequently the iron is not attacked, as indeed is apparent from the fact that the boiler has been but twice under repair.—*Gas Light Journal.*

**CAST IRON RAILROADS.**—An interesting experiment has lately been made by the Clyde Navigation Co. in the use of cast, instead of rolled iron for a tramway on the South Quay. The trial is said to have stood the severest tests for over four months, at a locality where the traffic was almost continuous with no signs of displacement or wear or need of repair. So satisfactory has been this experiment that it is said cast iron tramways are to be laid upon all the quays and yards of the Navigation Co. in Glasgow, with a prospect of good results and great economy. Here is an opportunity for American inventors in the street railway line.

**A MAMMOTH STEAMER.**—It is rumored that Daniel Drew and others have entered into arrangements to build a mammoth steamer for the Hudson river, which is to be run between Albany and New York to compete with the palace cars of the Hudson River Railroad. It is intended that the new steamboat shall be 500 feet long! The engine will be 100 inch cylinder and 18 foot stroke, and the steamer capable of making 23 miles per hour, and to average near that speed daily. The steamer will carry no freight, and will be run exclusively for passengers.—*Ex.*

## SCIENTIFIC PROGRESS.

### Vaccination and Disease.

The most experienced vaccinators, on the one hand, and those who have had most to do with the treatment of infantile ailments, on the other, agree in the belief that disease is not communicable by vaccination. Mr. Merson, an English physician, in the performance of more than fifty thousand vaccinations, "has never seen other diseases communicated with the vaccine disease, nor does he believe in the popular reports that they are so communicated." Mr. Lees, whose observations were equally extensive, has borne similar testimony. Dr. W. Jenner, who in six years had some thirteen thousand sick adults and children under observation, states "that in no case had he reason to believe, or even to suspect, that any constitutional taint had been conveyed from one person to another by vaccination." During a period of seventeen years Dr. West treated twenty-six thousand infants and children, with a like experience; and Prof. Paget, after an extensive familiarity with the diseases of children, expresses the opinion that the worst which can be charged upon vaccination is that, by disturbing for a time the general health, it may rarely give opportunity for the external manifestation and complete evolution of some constitutional affection which but for it might have remained rather longer latent.

Where every person in a community has been properly vaccinated, there is little chance for small-pox to obtain a foothold; and it is also very certain that the presence of the unvaccinated is a standing invitation to the development and spread of epidemics. The opponents of vaccination, and a far larger number who from ignorance or carelessness neglect the precaution, thus become, so far as the public health is concerned, a "dangerous class," which like other dangerous classes it is for the interest of the community at large to remove.—*Galaxy.*

**ENCKE'S COMET**, now on its way towards its perihelion, was seen from the observatory of the Sheffield Scientific School, on the evening of Oct. 13th. It was barely observable as a diffuse nebula. It will reach its perihelion on the 29th of December. This comet is principally of interest because its period of revolution has diminished about three days in the past eight years, a fact which is generally accepted as furnishing the best proof of the theory that the regions of space are filled with a material "ether" capable of retarding the motion of the bodies composing the solar system. Of course this resisting medium would produce annual effects upon the comet of a few tons in weight, that would not be experienced by our earth in the course of thousands of ages. But the result, though long deferred, is none the less inevitable—earth, plants and comets will all be eventually precipitated into the sun.

**NEW ASTEROID.**—Within a few months there have been three additions to the large family of minor planets between the orbits of Mars and Jupiter—all discovered by American observers. The first, No. 114, and the second, No. 116, were discovered by Prof. Peters of Hamilton College, the former July 23d and the latter on the 8th of Sept. last. No. 115 was discovered by Prof. Watson of Ann Arbor, Mich., Aug. 6th. The last discovery, Sept. 8th, forms the 116th of these fragmentary planets, (for such they undoubtedly are) all but four of which have been discovered within the last 26 years. Only one of these asteroids (Vesta) is ever visible to the naked eye, and that only under favorable circumstances. "Planetoide" is the title now more generally given to this group of stars, a term much more appropriate to their supposed origin and position among the heavenly bodies.

**A NEW PRODUCT FROM ENGLISH WALNUTS.**—According to Dr. Phipson, the English walnut, (*Juglans regia*), and probably the American species also, contains, among other substances, one which he calls *reganine*, (obtained by treating the green husk of the fruit with benzole,) which appears in the form of a yellowish substance crystallizing in groups of feather-like crystals. These are easily decomposed, and when treated with alkalis or ammonia, yield a splendid and durable red solution which by a subsequent treatment, becomes the jet black, amorphous, pure reganic acid.

**TO FIX DRAWINGS.**—The Marquis de Verrenes has discovered a method, which is equally simple and ingenious, of giving to drawings in pencils and crayons the fixidity of painting, and without injury. He succeeded in obtaining this result by varnishing them on the back with an alcoholic solution of white gum-lac. This solution quickly penetrates the paper, and enters even into the marks of the crayon on the other side. The alcohol rapidly evaporates, so that in an instant all the light dust from the crayons and chalk, which resembles that on the wings of the butterfly, adheres so firmly to the paper, that the drawing may be rubbed and carried about without the least particle being effaced. The following are the accurate proportions of the solution:—10 grammes of common gum-lac are dissolved in 120 grammes of alcohol; the liquid is afterwards bleached with animal charcoal. For the same purpose may be used even the ready-made paint that can be purchased at the color shops, containing a sixth of white lac, and adding two-thirds of rectified spirit of wine. After it has been filtered, there is nothing further to be done than to spread a layer of either of these solutions at the back of the drawing, in order to give them the solidity required.

**SCIENCE IN PRUSSIA.**—Sir Wm. Thompson stated in his recent address before the British Association, that in Prussia every university, every polytechnic academy, every industrial school, most of the grammar schools, in a word nearly all the schools superior in rank to the elementary schools of the common people, are supplied with chemical laboratories and a collection of philosophical instruments and apparatus, access to which is most liberally granted by the directors of those schools to any person qualified for scientific experiments. In consequence there will scarcely be found a town exceeding 5,000 inhabitants that does not offer facilities for scientific investigations at no other cost than that of the materials wasted in the experiments. And further, professors, preceptors, and teachers of secondary schools are engaged on account of their skillfulness in teaching, but professors of universities are never engaged unless they have already proved by their own investigations that they are to be relied upon for the advancement of science.

**ALBUMEN CHARCOAL.**—A preparation called albumen charcoal has been devised for the purpose of clarifying sugar syrups, and for which it is said to answer an excellent purpose, a very small quantity only being required. Its application in clarifying wines has been suggested, although it is not stated whether it is exactly suitable. To prepare this substance, finely powdered and purified animal charcoal is to be mixed to a stiff dough with white of egg, and torn apart into small pieces, dusted with the charcoal, dried, and pulverized, and again kneaded with egg albumen to a dough, which is to be dried and powdered anew.

**COMPLIMENTARY.**—Prof. Chas. A. Young of Dartmouth College, the astronomer who observed and reported the remarkable explosion in the sun, which we published last week, has received a cable telegram from Prof. Lockyer, the eminent English astronomer, inviting him to join the English Eclipse Expedition to India, offering to pay all his expenses, etc. This is a high compliment to our distinguished American astronomer, and it is a matter of regret that important home duties prevent him from accepting the invitation.

**THE FREEZING OF WATER.**—The interesting experiments of Boassingault, showing that water will remain unfrozen down to 18° C. when so confined that the dilatation due to freezing cannot be effected, and to which we alluded last week, was performed simply with a steel gun-barrel into which a steel ball was dropped before filling it with water. During the cold days of December, 1870, the temperature fell to -12° and -18° C., and yet on shaking the tube the ball was found to move freely, showing that the water was not frozen.

**THE CORDOBA OBSERVATORY.**—Further intelligence has been received from Dr. B. A. Gould, who, our readers will recollect, has been recently established in an observatory in the high region of Cordoba, South America, for the purpose of studying the southern stars. The Doctor and assistants have already observed and placed upon the maps 4,500 stars—more than half of which have never before been catalogued. His mission promises to be one of unusual interest and usefulness in the cause of astronomy.

## CORRESPONDENCE.

### Mines in Eastern Nevada.

The recent striking advance in the mineral values of some of the Comstock and Pioche mines has quickened the interest of the public in mining matters in a remarkable degree. To prevent the misdirection of this desirable impulse, a glance at the condition of Eastern Nevada may be serviceable.

No truth can be more securely established, than, that of all human pursuits, mining is the most secure and profitable, always promising adequate skill and competent capital. The merchant, manufacturer and agriculturist depend on the markets and seasons over which they have no control, while the miner with his educated intelligence, can securely predict his results, and with sufficient means can forestall all objects in his path to wealth. The past and current developments in our part of the State, have so far progressed under the indefatigable exertions of prospectors, as to invite securely the aid of capital in benefiting the discoveries made. "Wild cats" no longer infest our districts, preying on unwary travellers, and adventurers can safely traverse our territory in search of locations worthy of investments.

#### White Pine,

on the Axial ridge, that divides the basins of the Colorado and the Humboldt, looks down on either side on lands pregnant with indicated wealth. Eminent not only in position, but in the fertility and diversity of her ores, she yields the chloride smelting and fire-ores. The chlorides of Treasure Hill are illustrated by the Eberhardt and Aurora of limitless value, while White Pine Mountain is now exhibiting fire-ores, that under the Stetefeldt process are unsurpassed by any on the coast. Her smelting ores, are at present in abeyance, waiting the facilities that will be had on the completion of the Hamilton and Elko Railroad. Her near neighbor, Eureka, will partake of the benefits of this railroad by cheapening the transit of the unexampled quantities of bullion there produced. Eureka is reeking with ores peculiarly adapted to smelting, so much so, as to place it ahead of the celebrated Cerro Gordo, that made the first eminent success in that mode of reduction, and is at present unrivalled in the quantity and value of its lead-silver. The late discoveries in

#### The Groom District

(160 miles south) when abetted by the projected railroad facilities, may overshadow her in turn, in her special product, inasmuch as the gigantic vein of galena (120 feet in width) is charged with mineral, bearing silver from \$30 to \$60 per ton, and with aspects that according to the rule of Cerro Gordo, will, as the mine deepens, give at least double as much. This mine, like the other great mines of Eastern Nevada and Utah is in the Dolomitic rocks, with a shale interstratification, quartz, etc., crowning the adjacent heights, the whole intensified by basaltic cones that rear their black peaks in the distance. This mine giving a ton of bullion to two of ore, would seem in its 3,000 feet of length, to be an endless fountain of wealth. Lieut. Wheeler in his explorations of the present season, was so much struck with its magnitude and value as to pause in his journey, to make a critical topographic and mineralogic survey of it, and his report forms in part the basis of the present reference to it. A Hungarian expert, from Cerro Gordo visiting Groom, attracted by the report of its discovery, pronounces it a silver-lead unequalled in Europe or America. The Comet mine in Yellow Pine (the old Potosi) sold recently to English account for one million and a half, is a mine of the same class, and though spoken favorably of by the Hungarian, and Lieut. Wheeler, is ranked by both, as much inferior to the Giant Groom.

The observations of the present season by Lieut. Wheeler have changed his opinion respecting the route of connection between the Central Pacific Railroad and the Colorado river. The road from Elko through Hamilton, and between the Diamond and White Pine mountain ranges, is now deemed most eligible by him, not only for its shorter distance but for its relation to greater mineral values. Margining Ruby, Bald Mountain, White Pine, Grant,

Troy, Freiburg, Tom-pinte Groom and Southeast Districts, it has on the west the Railroad, Diamond, Newark, Pinto, Eureka, Secret and Spring Canons, Hot Creek, Tybo, Belmont, Reveille, Yellow Pine, Clark and New York, all valuable districts and sufficiently explored to justify the immediate application of capital for their complete elaboration, and thereafter ample support for a narrow-gauge railroad. At the present, in the absence of the connecting road, Groom, at 140 miles distance, and the other more southern district, depend for exit on the Colorado, which is not only tolerable, but will admit of a large productive margin on their exports.

#### The Pioche Mines

have such established reputation as to render reference to them unnecessary, save as a type of a large class of relative mines inhabiting the Schell-creek mountain range. Schell Creek, Nevada, Cooper, Patterson and Silver Park will more or less rival Pioche in the abundance of ores and facility of reduction, with superior conveniences in distance and wood and water. In conclusion, investments made with care and skill in this wide range of territory, must necessarily be profitable at present, with a future still more assured.

A. CADWALADER.

#### Mines Near Phillipsburg, M. T.

EDITORS PRESS:—Phillipsburg, located about 25 miles above the mouth of Flint Creek, is one of the old silver camps of Montana, that has the promise of a successful future. In the spring of 1866 a party of prospectors from Idaho, under the leadership of Chas. W. Frost, discovered this camp and organized the

#### Flint Creek Mining District.

The rich specimens exhibited soon caused a stampede, which resulted in building the present town of Phillipsburg, and a population of about 1,500 from every prominent mining camp on the Pacific Coast, soon assembled here. A 10-stamp mill supplied with Wheeler's pans and all the necessary adjuncts of a Washoe mill, was speedily erected and the croppings of the "Hope" run through, which yielded from \$50 to \$100 per ton. The old story of the big fish eating the small fry was here re-enacted, causing a general depression, and the town was left with a corporal's guard to take it in charge, the population scattering in all directions.

A couple of years since, Cole Saunders, of Helena, organized a company and commenced developing the "Poor Man's Joy," "Kitty Clyde," and "Speckled Trout" mines, which resulted in exhibiting rich bodies of base ore. He erected a couple of furnaces which met with poor success, no suitable fluxes being within reasonable distance. Nothing daunted by this failure, the company leased to the "Imperial Silver Mining Co.," under the management of Col. J. J. Lyon, their mines and works, which are now being changed to a dry crushing mill (5 stamps); the ores to be roasted in reverberatory furnaces, chloridized, and amalgamated in barrels. It is believed that this process will meet the requirements in the case and the rich ores of the "Poor Man's Joy," "Salmon," "Speckled Trout," and "Franklin," will be worked up to 80 per cent. of fire assay value.

Should this be done, and it certainly appears possible, the old days of "'66" and "'67" will be revived, and Phillipsburg will become the leading quartz camp of Territory.

#### The Mines

are located in limestone, but appear more permanent than usual in such formations. The Trout and Salmon cut the stratification of the country at right angles, and the vein in the bottom of an 85-foot shaft of the former appears full, strongly indicating the presence of a heavy body of ore. It is claimed that the ores of this mine will assay \$150 per ton in silver on an average. It shows a vein from 6 to 9 feet wide, and has every appearance of being a true fissure. The

#### Eastern Camanches

is a promising mine, and has three shafts averaging 50 feet in depth, each showing ore that it is claimed will mill \$50 per ton by wet crushing. It is probable that the

#### St. Louis

mill will resume operations this winter, crushing as a custom mill, which will dem-

onstrate the value of the "free ores" of this district.

Magnificent bodies of croppings are to be found in many places, and machinery is all that is lacking to give value to the mines. Sixteen miles up the creek, Cahle City is situated, in which is the famous

#### Atlantic Cable

gold mine, which has produced \$200,000 within 18 months, the rock averaging \$30 per ton. The mine is full of water now but will probably furnish quartz to the mill during the present winter. M.

#### SILVER STAR AND IRON ROD DISTRICTS, M. T.

EDS. PRESS:—This is the leading quartz mining district of Madison county, in which is located the celebrated Green-Campbell mine, which is owned and operated by a company of Cleveland capitalists under the name of

The Everett, Green-Campbell Mining Co., incorporated in Ohio, in 1867. As an evidence of their success and prosperity I will state that a 10-stamp mill has been crushing ore from their mine, night and day for over 15 consecutive months, and has in fact run since 1868, with comparatively little stoppage. The lode is worked to a depth of 109 feet, and to this level the operations have been confined for the past year. They are now, however, about to sink their main shaft from said level, and develop the lode thoroughly, which its fine appearance and results fully justify. The vein averages about 8 or 9 feet in width, and in places shows 13 feet of paying quartz. The mine ranks as high as any in the territory. It is located  $2\frac{1}{2}$  miles from Silver Star City; Thos. J. Johns, general manager.

There are many small lodes in the district, which generally look very promising, and are worked on a small scale with success by their owners, but require capital for speedy and large development. New discoveries are constantly made here, some of them quite valuable. The lodes are gold-bearing with few exceptions.

#### The Warm Springs

are not the least of the interesting features of this district, and one which supplies a bath-house well provided and arranged, lending a metropolitan air to the place. The mineral characteristics of these springs are highly commended for their medicinal virtues.

#### The Bedford Lods

is located west of the city, and owned by Ainslee & Tripp. The shaft is down 50 feet; the ore averages 3 ounces per ton. The company own a small 6-stamp mill, which is run by water power.

A small mill is being put up on the east side of the Jefferson, near the bridge, that was removed from Bannock. It is known as

#### The Bullock Quartz Mill.

There is a large pan 14 inches deep and 5 feet in diameter, in which are two wheels 22 inches in diameter. These wheels make 40 revolutions per minute, and the pan makes 20, thereby giving a grinding as well as a crushing motion. The company claim that this is one of the most simple and cheapest mills that can be put up in any new district, and that it will save from 5 to 10 per cent. more gold than any stamp mill process. The average cost of milling will be \$7 per ton, and from 3 to 4 tons can be run through in a day. The machinery is run by water power; the water being taken from a large irrigating ditch, and conveyed to an overshot wheel. Mr. Henry Guyer has run this mill very successfully for some years on Bannock ores. He is a practical mechanic and understands his business as a millman, well.

#### Iron Rod District.

This district is situated on the Jefferson river, four miles from Silver Star, has several quartz mills and many promising lodes. The most prominent of which are the Nugget, Effie May, and the well-known Iron Rod.

#### The Nugget Lods,

owned by Potter & Meagher, is 3 feet wide, the ore from which yields from \$50 to \$60 per ton. The rock shows coarse free gold. A tunnel is in on this lode 350 feet, and the shaft down 50 feet. The Effie May is a very rich four-inch crevice, turning out largely. But a few miles below Iron Rod is a 5-stamp mill owned by the Nugget Co. run by water power, and which crushes about 36 tons a week. Several arastras are running in the district and making good returns. The formation is granite.

W. H. M.

#### A Ditch for Mining and Irrigation.

EDS. PRESS:—Please allow me space in your valuable columns to call the attention of Capitalists and Ditch builders to one of the most valuable locations for a ditch there can be found in the State. I read almost every day accounts in the papers of the great ditch of the upper and west side of the San Joaquin River, which is to pass through one of the most fertile tracts of country, in a wet season, that can be found in the State; but which from natural causes, receives but little rain in dry seasons like the two past; consequently nothing is raised in such a season.

This ditch being built well back to the foothills, with the gradual slope of the land toward the San Joaquin river, will afford opportunity for irrigating a vast extent of excellent land, thereby converting what has ever been, in dry seasons, comparatively a barren waste, into a perfect paradise of vegetation, which the happy descendants of Adam and Eve might well consider a rival to the ancient garden.

There are also two ditches in process of construction at Lagrange, Stanislaus county. One is being built for mining purposes only, at a cost of a quarter of a million dollars. The other, I understand, is both for mining and irrigation. This is all very well; it will develop the resources of the mines and the agricultural lands in that vicinity, and thus revive the business prospects of Lagrange, which has been at a stand still for years, waiting for something of the kind to turn up.

Now, while this is all being done, I am surprised that a more valuable opportunity, in my estimation, on the Stanislaus river, appears to have been entirely overlooked. Let a company with a capital of \$250,000 commence at a point on the north side of said stream, near a place known as Central Ferry, ten miles above Knight's Ferry, where there is a very excellent site for building a dam and starting out with a ditch. A dam and two or three miles of ditch were built there some ten years ago; but the dam, not being well constructed, washed out, and the enterprise was abandoned for want of funds. A substantial dam, however, can be built there for \$8,000 or \$10,000. Thence start a ditch six feet wide on the bottom; run down the river, as far back as possible, about five miles, to near Six Mile Bar, passing O'Brian's Ferry; thence tunnel through Table Mountain, emptying into Littlejohn's creek; from thence you have a natural channel for the water, from which it can be diverted to irrigate that portion of Stanislaus and San Joaquin counties bounded by the north bank of the Stanislaus, Littlejohn's creek, Stockton and the San Joaquin river. Her mining resources would be still more valuable than for irrigation.

As the country from the starting point to Six Mile Bar embraces a large amount of mineral ground, from the creek it could be conveyed to the hills above Knight's Ferry by enlarging Spicer & Son's ditch, or building a new one.

There are on the hills around Knight's Ferry, above the reach of the old San Joaquin ditch, and within three miles of town, not less than 1,000 acres of good mining ground that could be easily reached with water from the contemplated ditch. The company should buy out Spicer & Sons to avail themselves of their privileges of Littlejohn's creek and other ditch franchises. They should also buy out the old San Joaquin ditch, from which water is furnished to the town of Knight's Ferry, and for irrigating innumerable gardens and vineyards in the vicinity, some of which are very extensive.

This ditch would be doubly valuable; for at the season when water was not needed for irrigation it could all be sold for mining purposes. I think it could all be accomplished at an expense not exceeding \$150,000 or \$175,000.

There might be an objection raised to embarking in the scheme—as the ditch would have to pass several miles over lands owned under Spanish Grant title, fearing the owners might charge high prices for right of way. But I know a party who holds the right to build ditches and reservoirs on any portion of the Spanish grant lands. Should this meet the notice of any party wishing to make an investment of this kind, my advice is, come and see for yourselves, as the water is extremely low now, affording an excellent chance for accurate observation.

CAPTAIN.

Knight's Ferry, Oct. 27, 1871.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**RUNNING.**—Alpine Chronicle, Nov. 4th: Exchequer mill on Wednesday commenced work on ore from the mine.

**TARSHISH.**—Alpine Miner, Nov. 4th: A good body of ore was struck this week in this mine, and in adjoining mines on the same lode developments are of a satisfactory character.

**MACHINISTS** are busy putting in the works of the Tarshish mill.

**GLOBE.**—The machinery for the hoisting and pumping works at this mine is being put up.

### AMADOR COUNTY.

**KENNEDY.**—Amedor Dispatch, Nov. 11th: The Kennedy mill is still pounding away and the rock continues to increase in richness as they go down.

### CALAVERAS COUNTY.

**WHAT CHEER.**—Calaveras Chronicle, Nov. 11th: Everything is progressing favorably at the What Cheer mine. The incline 500 feet in length, has reached the bottom of the channel and gravel is being taken from the lead. Judging from the results of numerous "prospects," it will pay well. The gravel is of a dark blue color, a certain indication that the veritable "blue lead," has been struck.

**BRACKETT & Co.** whose claim is on the Tunnel ridge side of Chili Gulch are getting out first-rate gravel.

**CORRAL FLAT.**—Champion & Co., are doing well. Their "clean up," on Saturday netted about \$6 per day to the hand.

**GRAVEL MINING.**—The Bunker Hill Co. are making arrangements to commence mining on a large scale as soon as they shall have a supply of water.

### MONTEREY COUNTY.

**BY TELEGRAPH.**—San Juan South, Nov. 12th:—An exceedingly rich strike has been made in the Cerro Bonito mine. A cut has been run 40 feet, cutting the vein which is 6 feet wide, and exposing one of the finest bodies of ore ever seen, with a foot of vermilion earth covering the ledge in its entire length. Parties are negotiating for the mine for \$200,000.

### NAPA COUNTY.

**QUICKSILVER.**—Vallejo Chronicle, Nov. 6th: The upper part of Napa county in the mountains to the eastward, is being prospected for quicksilver mines, several leads of which have been struck. Some 15 or 20 companies have been incorporated, but none have put up reduction works except the Phoenix in Pope valley. The latter have been retorting out from \$10,000 to \$15,000 worth of quicksilver per month for nearly a year. Sixty men are employed in getting out ores, etc., and during the month 300 flasks of quicksilver were retorted. The "Valley Mine" are using retorts and extracting small quantities of metal. The Phoenix has struck a body of cinnabar of considerable extent, and value their mine at several hundred thousand dollars. The furnaces will cost \$20,000.

### NEVADA COUNTY.

**WILLOW VALLEY.**—G. V. Republican, Nov. 10th: Kitts, Russ & Bradley, have taken out from the Montana ledge 400 tons of rock during the past year, which was crushed at the Oriental mill, and paid from \$20 to \$35 a ton. It was taken from a depth of 112 ft. The owners are making arrangements to erect steam pumping and hoisting works, and sinking the incline 100 ft. more. The pay chute on the Montana is about 400 ft. in length on the ledge. J. Kitts is putting up steam machinery on the Buckeye ledge, at the head of Willow Valley, and will sink a prospecting shaft to the depth of 100 ft. The Buckeye, near the surface, has produced very rich rock. The Murchie Bros. have recently sunk a shaft 100 ft. deep on the Murchie ledge, and taken out good pay rock. The Oriental mill is running night and day on rock from the Orleans ledge.

**GOLD TUNNEL MINE.**—J. H. Helm, has the hoisting and pumping machinery completed, and has commenced sinking a new incline.

**JIM MINE.**—The Jim mine, about 3 miles south from Eureka, is being systematically developed. A tunnel was commenced last spring 1,000 ft. distant and below the old incline shaft. This tunnel has been run into the hill 600 ft., and recently struck the ledge, which is 20 inches thick, and prospects well in free gold and good sulphurets. This winter a drift will be run

on the ledge from the tunnel to the old incline, a distance of 500 ft. This will develop the mine thoroughly, and open an immense quantity of ore, as the "backs" from where the tunnel strikes the ledge are 225 ft. from the surface, and they increase in depth toward the bottom of the old incline, to which point the drift is to be run. At the latter point the ledge will be 275 ft. from the surface. For a period of 9 months, rock near the surface averaged \$20 a ton, and \$1,000 a stamp for each month. On account of the severity of the winter at the mine, the mill will not commence crushing ore before next May or June.

**OMEGA.**—At Omega the principal mining Co.'s are waiting for the rainy season to fill their ditches. During the past summer unusual preparations have been made in placing the best gravel claims in a complete state of readiness for hydraulicing. A large amount of drifting and blasting has been done. Tully & Co. have 2 sets of claims, and will be able to use from 1,500 to 2,000 inches of water; Burwell & Fuller will use from 500 to 700 inches; Kyle about 500 inches; Sale & McSorley also 500 inches. The Omega ditch has been thoroughly cleaned for its entire length, and new flumes, etc., erected. At Diamond creek, Cal Kirtly and others have made extensive preparations for hydraulicing, and are ready to commence as soon as water comes.

**STRIKE.**—A strike has recently been made at Buena Vista Slide. Some excellent prospects were panned from the gravel.

**GREENHORN.**—Gress Valley Union, Nov. 10th: Work on the Greenhorn mine is being vigorously prosecuted. The mill can not be run, because there is no water. The shaft has been put down 106 ft., making the total depth 242 ft. Sinking is going on all the time, and will be prosecuted until the rains come so that the mill can be run, when levels will be opened from the bottom of the shaft. It is thought 256 ft. can be reached in the shaft before drifting becomes necessary. The ledge in the shaft is from 2½ to 3 ft. in thickness and shows well.

**GRAVEL MINES.**—The Altonea Gravel Mine, on Alta Hill, is doing well. A recent run gave \$16 per day to the hand.

The Hope has been doing a good business. A run of 19 days gave 179 ozs. of retorted gold, and the appearances are that the present run will be a better one than the last.

**SOUTH STAR.**—The South Star Mine is being constantly worked. The yield of rock at the last crushing was \$70 to the ton. The ledge is a very large one.

**STRUCK.**—National Gazette, Nov. 10th: Some miners, working near the old Twelve Mile House, have found a very rich prospect.

### PLACER COUNTY.

**RICH STRIKES.**—Auburn Stars and Stripes, Nov. 9th: A deposit of marvelous richness and extent has been struck in the Yule gravel claim a short distance above Lest Chance. It is also reported that an extremely rich development has been made in the Shannon quartz ledge near the North Fork, a short distance below the town. Reports are also highly favorable from the Greene, Crandall, Ophir, St. Patrick, Shipley, Clark and Bellevue claims in Ophir. Dist.

### PLUMAS COUNTY.

**TUNNEL ENTERPRISE.**—O'Neil & Bros. in Newtown are making good headway in their tunnel. They intend to open and work the Nevada claims, and to do this it was necessary to run a tunnel some 350 feet in length. They are now in nearly 300 feet.

### SAN DIEGO COUNTY.

**BULLION.**—San Diego Union, Nov. 2d: The shipment to San Francisco on Tuesday was a little short of \$1,000.

**RAIN AT THE MINES.**—On account of the recent rain, all the mills are at work day and night, with the exception of McMechen & Whitneys. The proprietors of this mill are awaiting the arrival of the engine before they can resume work. "Kentuck" boys had a small lot of ore crushed which yielded \$62.50 per ton.

**MINING NEWS.**—From Julian we learn that the owners of the Golden Chariot mine have struck more rich ore in their lead. It is spoken of as being considerably richer than that which is at present on the dumps of the company, and will go fully \$200 per ton. The McMechen mill finished (previous to stopping) crushing 205 tons of Redman rock which yielded more than any ore previously crushed from this lead. Since the Redmen mine has been opened, 700 tons of its ore have been crushed at an average yield of \$17.50 per ton.

### SIERRA COUNTY.

**PORT WINE.**—Cor. Mt. Messenger, Nov. 4th: The mines here are nearly all paying wages with encouraging prospects. The Indie Queen company whose claims are adjoining those of the Union company's, some time since purchased from the latter a small piece of disputed ground for \$6,300; they are now working the ground and making fine wages. The Union claims are paying very well. Monte Cristo company after running a bed rock tunnel, are taking out the auriferous gravel.

## Nevada.

### COPE DISTRICT.

**MT. CITY.**—Cor. Silver City, Idaho Avalanche, Nov. 4th: The quartz mills are at work constantly, and the mines are paying handsome dividends. Whims, steam-hoisting works, and the latest patent furnaces for roasting ores are being erected.

**LUCIN.**—Cor. Elko Independent, Nov. 11: All the mines look promising. The Tecome has been tapped by a tunnel at a depth of 200 ft., showing an average width of 4 ft. of carbonate and crystallized lead ore of a very high grade.

There are upwards of 100 locations in this dist., many of which bid fair to become good mines. Nearly all the parties owning claims are vigorously prosecuting work.

### EUREKA DISTRICT.

**WASHINGTON.**—Eureka Sentinel, Nov. 10: This property is on Adams Hill, a short distance southeast of the Belmont mine. The shaft is down about 10 ft., disclosing pure and unadulterated milling quartz the entire distance. The vein matter is, on an average, about 6 ft. wide, and from wall to wall this ore is estimated to mill \$40 per ton. At the bottom of the shaft a strata of extraordinarily high grade ore varying in width from 12 to 16 in., has made its appearance.

**PIONEER, No. 2.**—This mine is on Prospect Hill, in the immediate vicinity of the Chattanooga. The main shaft is down 24 ft., and a tunnel, starting a considerable distance below, is in 30 ft. At both points excellent ore has been developed; that found in the shaft going \$150 to the ton, while the average assays from the tunnel are in excess of \$360 per ton. There are from 50 to 60 tons of ore on the dump.

**CHATTANOOGA.**—Recent developments make it certain that this is one of the finest pieces of mining property in the vicinity of Goodwin Cañon. At present the mine has been opened by a shaft, in connection with a tunnel, which measures 50 ft., run on the ledge, all showing a fine body of ore, contained in a well defined vein, traceable the complete distance.

**RICHMOND CONS. M. Co.**—The mines of the Co., comprise the Richmond, Colorado and Virginia, located on Ruby Hill, immediately adjoining the property of the Eureka Cons. Co., on the west. The amount of ore in sight in the Richmond is immense. The bed vein by actual measurement is over 100 ft. in width. There are some 500 ft. of drifts, all hewn through solid ore. Our attention was called to one column of ore over 30 ft. in height, estimated to contain 3,000 tons. The furnace yield for the month of Sept. was \$64.30 per ton. The Smelting works consist of one large-sized blast furnace, capable of reducing 40 tons of ore per day. Foundations have been laid for 2 furnaces, of a larger size than the old one.

**EUREKA.**—Cor. Reese River Reville, Nov. 8th: The Metropolitan mill, will soon be in shape to commence operations. A fine body of high grade ore has just been struck in the tunnel and shaft of the Pioneer Claim No. 2 on Prospect Hill.

### ELY DISTRICT.

**BULLION.**—Pioche Record, Nov. 2d: W. F. & Co. shipped since Oct. 29th, 36 bars valued at \$43,007.57.

**COMPLETED.**—The Statesfeldt furnace, connected with the Chicago mill, at Bullionville, which has been in course of erection for some months past, is now completed and starts to-day.

### HUMBOLDT.

**SHIPPED.**—Unionville Silver State, Nov. 11: Amount of bullion shipped from the Arizona mine, since our last issue, was \$6,051.

**GOOD YIELD.**—Two weeks since 15½ tons of ore were shipped from the Arizona Cons. M. Co. to S. F. which rated at \$510.25 per ton, amounting to \$7,781.40.

**PHENIX.**—The Phoenix mine, Star Dist., is beginning to show very encouraging prospects for a rich mine.

**STRUCK IT RICH.**—In the Arizona Cons. a large body of sulphurets ore was struck in an incline near the south end of their main tunnel equal to anything ever found in the mine.

**MILL STARTED UP.**—In Dun Glen Sprengle & Co.'s quartz mill started yesterday, and all the machinery is working satisfactorily. Paul's dry amalgamation process is a complete success.

**GALENA.**—Cor. same:—It is reported that the Trenton mine, 7 miles west of this town, has been sold to an English Co.

The Little Giant mill, at Battle Mt. will be started up in a few days.

### ESMERALDA DISTRICT.

**AURORA.**—Cor. same: Twenty-three tons of rich rock from Hot Springs, passed through here to-day for reduction. The new mill recently erected there is not progressing very favorably.

### REESE RIVER.

**N. Y. CANON AND YANKEE BLADE.**—Reese River Reville, Nov. 4: A good deal of high grade ore is being taken out of the above named localities, though the number of miners engaged is not very large.

In N. Y. Cañon the principal Co. is that of Kling & Co. They work 6 men and are taking out ore.

In Yankee Blade Cañon, the O'Leary mine is being worked with good prospects.

In Yankee Blade proper, Sennett & Co. are taking out rich ore in small quantity, and Kane & Co. are operating on the Virginia mine from which good ore is being extracted.

**GRAHAM AND JENNINGS TUNNEL.**—This property is proving to be very valuable. The mine is being worked in 3 places and at each point a large ledge of ore is displayed.

The Groves are working one portion of of the mine and have two other sections leased.

Stenton, Calvert, Delano & Lamb, at the farther end of the tunnel, have struck a superb body of ore. Another section of the mine is leased by Gillan, McIntire & McDonald. They have a large ledge of first-class ore in the bottom of the incline, having struck it some time ago.

**SAVAGE.**—A portion of this mine has been leased by Smith & Ramsdell. They are extracting a considerable quantity of fair ore.

**ESTHER.**—The new hoisting works on this mine are now enclosed. The incline is being cleared and re-timbered in splendid shape.

**METACOM MILL.**—The machinery of this mill was put in motion on the 1st inst. for a trial. It will be crushing ore in a few days.

**REVENUE MINE.**—This old claim has been leased for two years.

The lessees have cleared away the rubbish in the old incline, erected a good whim, and inside of 6 weeks commenced taking out a splendid class of chloride and sulphurets ore. The ledge looks first rate, being large and well defined.

### WASHOE.

**BULLION.**—Virginia Enterprise, Nov. 11th: There was shipped from the offices of W. F. & Co., during Oct., 542 bars of silver bullion of the total value of \$867,179 75.

October receipts of bullion from the Hele and Norcross mine footed up \$72,776. This yield last week amounted to 400 tons of ore.

**CHOLLAR-PORTER.**—The ore producing sections of this mine show continued improvement. Last week 1,000 tons were extracted, the average assays of which were \$45 per ton. Total receipts for Oct., \$73,142 71. They are prospecting both to the northward and southward on the Potosi tunnel level, and also at the first station of the new shaft, 200 feet below the mouth of the shaft.

**SAVAGE.**—From 70 to 80 tons of ore per day, milling \$20 per ton, is being taken out. A considerable amount of prospecting work is being done in various parts of the mine. Last week the mine yielded over 600 tons of ore, averaging, as per assay, \$32 16 per ton, or over \$19,000 in bullion.

Sierra Nevada Co. are steadily at work. The mine is yielding an abundance of low grade ore, and the mill is kept in constant operation.

**BELCHER.**—This mine is looking well throughout. The south drift is in 220 ft., and is in fine ore, which assays \$138. The slope on the sill floor is 115 ft. in length and 75 ft. in width, with no east wall found as yet. They have commenced to rise on their third floor. The average of the assays of the mine for the past month have been \$119 37, and average of the pulp assays \$111 67. During the month they extracted 4,589 tons of ore, 4,209 tons of which were milled, and 380 tons of which were carried over. The bullion yield for Oct. was \$310,000. During the present month they expect to extract 250 tons per day, and think the yield in bullion will amount to about \$400,000. The following

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

**IMPROVED WARDROBE.**—Anna Davis, Reno, Nev. The object of this invention is to provide an improved portable wardrobe for clothes, etc., and it consists in a light frame-work oblong and rounded at its ends, and arranged with hinges so as to be opened and closed. A sort of hook and stout eye are fixed, one to a supporting bracket of peculiar construction, and the other to the top of the frame, and by these the wardrobe can be supported from any wall or point desired. The frame-work is covered with cloth, leather, or any suitable material, and the whole can be taken in pieces so as to pack for transportation.

**GANG PLOW.**—J. M. Huie and Elisha Card, San Francisco, Cal. This invention relates to certain improvements in gang plows, by which the labor of raising the gang from the ground is performed by the team instead of the driver, and it consists mainly in constructing the supporting frame of the plows so as to slide on two inclined planes suitably attached. A rod extends forward from the cross-bar, which slides on these planes and passes beneath the pole, and is so arranged that when the holding lever is released from its rack, the draft will act directly to raise the plows by sliding the bar up the inclined planes.

**WHEELBARROW.**—Wm. McKibben, San Francisco, Cal. The object of this invention is to provide a wheelbarrow which shall combine lightness, strength and cheapness of construction, and it consists in forming the sides and cross-bars of bar iron set on edge and peculiarly curved at the wheel end so that the wheel is set well under the box and load. This latter condition is also favored by the peculiar construction and setting of the box. The wheel is also of novel construction and is light, strong and easily made.

**GRAPE CRUSHER.**—Schoenstein & Klein, San Francisco, Cal. This invention relates to an improved machine for crushing grapes and other small fruit and removing the stems before pressing. It consists of a proper shaped box inside which is a cylinder provided with teeth. This cylinder is revolved inside a wire cloth concave which is also provided with teeth at each side. The bottom of the hopper into which the grapes and their stems are thrown is formed of bars similar to a grate, and the teeth of the cylinder pass between the bars and draw the grapes and stems down into the concave. After passing through the concave the stems are caught on an outside shaft and drawn to the outside upon an apron from which they fall to the ground, while the crushed grapes fall between the concave and box and thence to the bottom of the box, where they are passed between the pressing rollers.

**ENGLISH PATENT LAW.**—The movement already mentioned in the Press for improved patent laws in England contemplates the following provisions:—

That inventors have a right to the sole use of their inventions, which it is the duty of legislature to harmonize with the interests of the State.

That patents should no longer be granted to mere "first importers," but should be confined to actual inventors.

That the term of a patent should be twenty-one years—now fourteen—without provision of extension.

That the official fees should be reduced from one hundred and seventy-five to ten pounds for the entire term, which is sufficient to defray the expenses of an efficient patent system.

That the French mode of granting patents—without official investigation of the merits of the application—should be adopted.

That in patent suits the rights of patentees should be determined by a competent court of equity, dispensing with *jurors* and "expert" witnesses.

### Utilizing the Mountains.

During the past summer, says the Sacramento Union, hundreds of thousands of sheep were grazed upon the high Sierras, at altitudes ranging from 4,000 to 8,000 feet above sea level. At the heads of all our rivers there are broad meadow lands, covered with a rank growth of grass from the month of July until the coming of the first snows of autumn, and watered by innumerable lakes and ponds. It is this region which supplies our best sheep pastures. Its extent is hardly yet known, but we may safely say there are several million acres of such meadows open to pasturage for four and a half to five months in the year, and at altitudes no higher than 4,000 feet for eight months. There is room in that region for twenty million sheep, or five times as many as we now have in all the State. It costs nothing but the driving and herding to make these splendid pastures available.

In Spain the great flocks of sheep are driven slowly along the Pyrenees in one direction during the opening of the season, and back again over the same ground toward the close of it. Here our sheep farmers are gradually falling into a like system. During the months of early spring the southern slopes of the lower foothills afford good pasturage, and on these hundreds of thousands of sheep are grazing from February to the middle of April, without reaching an altitude of 2,000 feet. From the middle of April to June they are driven by slow stages up into the great and open timber regions, on a line parallel with the Calaveras big trees and the sources of such second-class streams as Weber Creek, the San Antonio, Mariposa creek, etc. About the close of June the snow has pretty well disappeared on the mountains not above 6,000 to 8,000 feet, and it is at such altitudes, upon the mountain meadows, where the great lateral branches of the Sacramento and San Joaquin—as the American, Cosumnes, Yuba, Feather, Kings and Kern—take their rise.

When the sheep reach these meadows they are stopped for several months, and it is found that they fatten very rapidly and improve in health as long as they remain. There are in fact, no better pastures in the world for sheep, and everywhere the best of water, clear as the Lethe of Dante and cold as ice, abounds. The timber of this region is chiefly hackmatack, dwarf cedar and spruce. The climate is always cold to a valley resident, and the nights always bring frost. Wild animals, enemies of the sheep, are not numerous. The grizzly bear is the most formidable, and next the puma and large gray wolf. Coyotes never go so high up. Between the two "summits," as we have named the two distinct ranges of the Sierra Nevada, and beyond these meadow lands, is a system of larger lakes, each having a valley of greater or less size, and beyond the eastern summit, is another system of still larger lakes and valleys, among which are Goose lake, Honey and Pyramid, in the north, and Owen's lake and valley, and Walker lake and valley in the south. These last are generally not above 4,000 to 5,000 feet above sea level, and constitute the best grass farming districts on the coast south of Oregon. The lakes and valleys between the two "summits," among which are lakes Tahoe and Silver, and Yosemite valley, are not so large as those east of the eastern summit, but the lakes are deeper. The climate in these is severe in the winter and cold in the summer; but the limited pastures are the best in the world for dairy farming. During the past summer, we learn, there has been a good deal done in this business, and very many of these small valleys have been occupied by herds of cows driven up from the Sacramento and San Joaquin valleys, where there has been no grass at all. Hermit valley, at the head of the Mokelumne, on the Big Tree and Silver Mountain road, containing about 200 acres of level land, has all summer, since the 1st of July, produced an average of 100 pounds of butter daily, besides cheese. Hope valley, and the valley of Silver Lake, have in like manner been utilized. It is probable that as new explorations develop new valleys in these Alpine districts, there will be a system of dairy farming organized on a grand scale; and so, what with sheep-ranching and the timber business, there is a good prospect that in a few years the high Sierras will be settled with a more thriving population than now inhabit the old belt of the placer mines.

MANY outrages are reported from Provo, Utah, growing out of difficulties among mining companies. Witnesses are assaulted and beaten, and obnoxious men are shot at by the partisans of the various mines.

### California Experience in Chicken Raising.

**EDS. PRESS:**—For nineteen years I have been watching the successes and failures in hatching and rearing chickens on this coast, and I have a few items which I propose to offer your readers.

#### Hatching.

If you wish to hatch eggs on a large scale, and feel willing to watch them closely day and night three weeks, then hatch by artificial heat. But first send to the office of the PACIFIC RURAL PRESS and obtain "The Peoples Practical Poultry Book," study it and talk with intelligent and experienced men. Do not listen to the thousand whims in everybody's mouth; but follow the directions of your book exactly to the moment of time and the degree of heat, by not observing which nearly all that try it fail. You may hatch out a thousand eggs at one time, more or less, and your chickens will be less trouble and more healthy than if hatched by hens, and entirely free from vermin.

After your eggs have been warm four or five days, you may select those that will not hatch. Hold them one at a time between your eye and a candle, and send to market all that look perfectly clear, retaining only those that have become clouded.

#### Producing Eggs—Does it Pay?

That you must decide in the light of the following facts:—A hen is supposed to eat about 60 lbs. per year. At present prices it will cost \$1.50. If she lays 60 eggs, and you get, on an average, 35 cts. per dozen you will make just 25 cts. on each hen. But when you reckon the expense of roosters and the losses by disease, vermin and thieves, you cannot hope to do nearly so well as the above estimate. Some do much better, but many much worse, owing to the difference in the breeds of chickens and the cost of feed.

Some hens will lay 80 and 100 eggs during the year; while others will not lay 20. Some persons are now feeding boiled potatoes, at from \$5 to \$10 per ton; raw onions, at \$7.50 per ton; fresh meat at 3 cents per lb.; scraps, after the lard is pressed out, at 1½ cts. per lb., and grain at a reduced price. Then they always sell their hens after they have laid two years. By all this economy they hope the income from the eggs will be more than the expense of the hens.

#### Diseases.

After watching the poultry stalls in San Francisco for several years, I conclude that most people get rid of their sick chickens by rushing them into market. Please make your own comments. If you hope to keep your chickens healthy do not buy a few diseased ones and mix them with your healthy ones, as many are now doing; for their diseases are exceedingly contagious. Give them exercise by placing their grain where they must scratch for it. Give them fresh air by permitting them to roost on trees or in open houses during the warm weather. Give them a variety of food—corn, wheat, barley, oats, broom-corn seed, rice, potatoes, onions, bran, shorts, red pepper, meat free from salt and every thing else they like. If they cannot find worms for themselves mix fresh meat and wheat bran together, and in a few days you will have a good supply for them.

If you have no green grass for them, moisten a lot of grain and let it sprout and thus you will have a good substitute. If you have not a good supply of running water, drive sticks at the side of the trough slanting across it so that they cannot get their feed into it, or nail the sticks to the side of the trough and thus keep the water clean and fresh.

J. PETTIT.

Oakland, Oct. 24th, 1871.

**SHIP BUILDING IN ENGLAND.**—It is reported on good authority that there are no less than 5,000 vessels, of various grades, now in process of construction in Great Britain. The larger number are being built of iron, among which steamers preponderate. A very large proportion are being built with special reference for making the voyage to India via the Suez Canal. The English are determined to leave no effort untaken to keep their hold on the vast carrying trade of India and China. California and the Pacific Railroad will have to be up and doing if they would divide this business with our cousins over the water.

### Dangers of Coal Mining.

The coal miner, the veteran of the mineral world, whose origin dates back many years in the world's history, is more subject to danger, day after day, than perhaps men of any other calling. He struggles against the multifarious dangers of the mine, and combats, hand to hand, the elements of the ancients—earth, air, fire and water—all of which are in conspiracy against him. The air, by becoming mixed with explosive vapors; fire, in blasting, in the firing of the coal and in explosions of fire damp; the earth, in caves; the water, by inundations. All these are to be opposed by the intrepid courage and practical science which tend to make the skilled miner.

Fire is the most terrible enemy which the collier has to contend with, especially when caused by "fire damp"—a combination of hydrogen and carbon—which, when mixed with atmospheric air, becomes explosive. In this state it often causes fearful destruction—burning, overthrowing, destroying and killing everything in its path. The men are blinded and scorched, and the effects are the same over every part of the mine where the explosive gas is present. Sometimes the walls and roofs cave, and, to add to the horrors of the situation, carbonic acid gas, after the explosion, spreads through the mine, and those whom the work of destruction has not already killed, generally terminate their existence by suffocation. An old miner who has experienced one of these fearful explosions, and who fortunately came off safely, thus describes his situation and feelings:

"As soon as the explosion occurs it drives like a whirlwind and with force enough to carry any weight before it in the direction of the nearest vent. In going it sweeps along the ceiling, tearing away props, brattices and everything else, even the pillars of coal. The unfortunate miner who may be within its influence, instinctively throws himself flat upon the ground. Before he can rise the gas has encountered the body of air moving in an opposite direction. They come together with an elastic shock, sufficient to change the direction of the gaseous tornado, and back it comes with a rush, lifting the miner and flinging him probably a distance of 50 feet against the ragged coal. Behind again there is a shock of pure air and foul, and again the gas whirls back with undiminished fury, lifting the miner once more and dashing him back whence he originally came. Again and again this terrible game of battledore is repeated. Nothing can resist its impetuosity. Meanwhile the terrible after-damp accumulates with surprising rapidity. This is composed of the black damp which hangs from the roof and the white damp which gathers along the floor. It joins the gas at every rush, and adds power and volume to it. The helpless miner struggles with superhuman strength to resist the buffeting of the mine-flood, but now the damp begins to seize upon his senses. The sensation is not unpleasant. He feels slight dizziness; he becomes weak and sleepy; he staggers; his knees lose all their power and he falls."

**MOSS AGATES.**—A large deposit of moss agates has been found on the banks of the Chitika and on Willow Creek, some twenty miles from Portland, Oregon. The discovery will not prove of any especial value however, as the market for these stones is already oversupplied from the deposits in Wyoming and Montana Territories.

TIME is the earth's attribute, and as the earth leisurely and regularly renews her drapery of foliage and flowers, so she reconstitutes the forms of her surface and moves her continents and seas from place to place in the long lapse of ages, to which the life of man is but as one undulation separated from the myriads of luminous waves which are required to impress us with a sense of solar force.

LONDON papers announce the death of Mr. Thomas Pilgrim, aged 71 years. Mr. Pilgrim acted as chief engineer of the Archimedes, the first ship ever sent to sea propelled by the screw.

## USEFUL INFORMATION.

## Spontaneous Combustion.

In March last, a well-known Detroit chemist, assisted by two seriously inclined and science-loving gentlemen, resolved to make a number of experiments to test the worth of the talk about spontaneous combustion, and their experiments are well worth the attention of every reader.

They first took a piece of cotton cloth, which had once formed a part of a sheet, and which had been used until quite threadbare, and smeared it with boiled linseed oil. An old chest was placed in the loft of a store-room back of the drug store, a piece of zinc over it, another paper under it, and then the chest filled with paper and rags, and this particular piece of cloth placed in the center. Although the room was not a light one, and the weather cold, in eight days there was such a smell of fire about the trunk, and the chances were so good for a conflagration within it, that the contents were emptied.

An examination showed that the fibre of the oil-cloth had untwisted and shriveled up, and that the rag looked as if it had been held too near a hot blaze. In April, when the rays of the sun were stronger, a pair of painter's overalls, literally covered with paint and oil, were rolled up, a handful of pine shavings placed inside, and these were crowded in next to the roof boards of the loft. The experiment was not a week old when, during one warm afternoon, a smell of smoke alarmed a workman in the next room, and he found the overalls burning, and so tinder-like was the cloth that it had to be crowded into a pail of water to prevent total destruction.

During the hot weather of August, a handful of old cotton rags, in which two matches were placed, but which were not smeared with oil or other matter, were shut up in a tin box, and hung up in the loft, a rear window allowing the afternoon sun to shine directly on the box for several hours. Toward the close of the fourth day the chemist took down the box to see how the experiment was progressing, and found the contents to consist of nothing but a puff of black cinders, which flew all over him as the lid was lifted. Having a vacant corner in his brick wood-house at home, the chemist took the trunk up there, where there was no danger of burning a building. He filled the trunk with the contents of the paper rag-bag, and then smeared one with benzine and threw it in last of all. The trunk was shut tight, everything cleared away from its vicinity, and he commenced watching. One day the family came home to find a few ashes marking the place where the trunk stood, while the bricks above and around were badly stained with smoke.

**ARTIFICIAL RAIN.**—In England, where experimental agriculture is carried to an extreme almost unknown with us, the inventions of methods of irrigation have been very ingenious. At Stoke Park a tract of twenty acres is irrigated by artificial rain, the system being quite successful. The water was applied every night last summer in showers, excepting when natural rain made it unnecessary. The apparatus consists of pipes laid in the ground, supplied from the elevated reservoir, into which water was pumped by machinery. The financial exhibit made by the results of the experiment is said to be a good one. The interest on the money invested in the necessary machinery, and the cost of operating it, aggregated \$95 per acre for the entire tract of twenty acres. Likewise the income per acre aggregated \$200, being made up of the proceeds of one crop of grass and grazing in the autumn of 1870, and two crops of hay in 1871. The net profit was thus \$105 per acre. On land of the same tract and same character, used for the same purpose, but where the irrigation was omitted, the net profit per acre was but \$45.

The active principles of many plants are found to be more concentrated under the slower growth of cold regions, where the vegetation is less luxuriant than in warm climates; thus tobacco grown at the North is stronger than that raised at the South, and the same is said to be true of celery.

Mr. A. R. WALLACE, who lived for years in the East Indies, says that the popular notions of the gorgeousness of tropical vegetation are incorrect; flowers being less effective in lending color to the landscape than in temperate climates, since they are fewer in proportion to the mass of mere foliage.

## Paper Clothing.

The uses to which paper is applied are constantly multiplying, until it is now made serviceable in nearly every department of manufacturing industry. The paper collar was considered an ingenious novelty when it first appeared, closely followed by cuffs, frills, etc., of the same material; but the attempt to apply the same principle to the production of other articles of raiment was for a long time unsuccessful. An English inventor has at length, it is said, surmounted the difficulties of the case, having produced a fabric from which all sorts of clothing for the person and for beds, as well as numerous articles employed in furnishing an apartment, can be made at small expense and of a very durable character. The paper thus used is made from a pulp composed of wool, silk, hemp, cotton, flax and jute, which is subjected to bleaching and felting, and a fabric thus obtained on which a strong seam can be made with the same facility as upon the cloth. Shirts, skirts, pantaloons, talcloths, blankets, etc., are made of this material, possessing such toughness and flexibility as scarcely to be distinguished from linen or cotton cloth. The process is new to the European and American markets, but a similar art has been long in use in China and Japan, where a paper coat which will stand a reasonable amount of wear can be bought for ten cents, and a whole suit for twenty-five cents.

## Wooden Nails.

In these days of millions of iron, copper and zinc nails, tacks and brads; of lightning, self-feeding, and almost automatic nail machines, it is wonderful to find wooden nails coming into use. Yet that such is the fact, the *Shoe and Leather Reporter* informs us. Wooden pegs, made by the same machines as shoe pegs, are now largely used for fastening boxes, and manufacturers receive large orders from the West, for inch pegs for this purpose. In China, Japan and Hindostan, pegs of bamboo have been always used in fastening tea chests and other wooden packages. In this age, however, it looks like retrogression to use wood for purposes for which iron seems so much better adapted. As one of the curious freaks of the habit, so inherent in human nature, to return to former customs under the impression that they are novelties, the above is noteworthy, but we do not anticipate a fall in cut nails from this cause.

**PATNA KIPS.**—The uninitiated may thank the *Shoe and Leather Reporter* for the following definition of the term "Patna Kips," so often seen in trade quotations: "Patna kip is the hide of a two-year old steer or heifer, and is supposed to be anything in the shape of a hide weighing less than 16 lbs., the average weight being about 10 lbs. When properly tanned and dressed, these hides make fine leather, ranking next to calfskin. A patna kip hide, as a general rule, comes to market salted. These hides are shipped to his country at Calcutta, and are the produce of the Province of Bahar, in Hindostan. Their distinguishing marks are difficult to give, but experts readily recognize them. The dead green is the hide taken from the carcass after it has died on the plain. The difference in price between the slaughtered Patna and the 'dead green' is about 21 cents per lb."

Some recent experiments at the Philadelphia High School developed the fact that when a strong solution of phosphorus in bisulphide of carbon is poured upon finely powdered chlorate of potassa, resting on paper, and the mixture is exposed to air, upon the evaporation of the bisulphide of carbon, the phosphorus being left in a very finely divided state, intimately mixed with the chlorate of potassa, the mixture presently explodes spontaneously, with a loud detonation.

**GOBELIN TAPESTRIES.—DELICACY OF THE EYE-SIGHT.**—The various colored wools used in making the celebrated Gobelin tapestries are arranged at the manufactory according to their shades. These shades are 28,000 in number; and, as an example of the power and delicacy of human eye-sight, it is said when two of the approximate shades are compared, the eye distinguishes them with facility, and perceives the interval which separates them.

A PAPER ON Ancient Dentistry, presented to one of the scientific associations not long ago, showed that gold was used by the Romans for filling teeth, and for holding artificial teeth, five hundred years before the Christian era.

## GOOD HEALTH.

## Medical Philosophy.

It is a matter of regret, says a correspondent of the *Boston Journal of Chemistry*, that in the regular profession of medicine there is no system of medical philosophy. We have a vast accumulation of facts, the result of the most careful and scientific observation and experiment, and a certain amount of deduction as the result of investigation, but no comprehensive philosophy, to govern the physician in his treatment of disease.

It is believed that medical art has kept pace with other improvements, for which this century is so remarkable, and what is to be the progress in the future no one can predict; but no one can doubt that it will make even greater advances than in the past.

The want of a comprehensive medical philosophy to which I have alluded, may not be recognized by a physician already established, but to the young man just commencing practice the want of such a guide must be keenly felt.

The homeopath has a simple philosophy in the words *Similia similibus curantur*, and while it captivates many intelligent people, a large majority of physicians do not believe it to be true, and are incredulous as to the capability of matter to be subdivided to the extent claimed by their practice.

If the medical profession are ever to have a medical philosophy which is true, it must be the legitimate deduction from facts, and with a view to take the first step in the desired direction, you will permit me to announce a single principle by which I have been governed during a somewhat extensive practice.

It is well known by physicians that the human body is composed of quite a number of substances, such as albumen, globuline, fibrine, caseine, and keratine, among the proteine compounds; gelatine, chondrine, fatty matter,—organic acids and inorganic acids, etc.; till we come to the metallic bases: potash, soda, ammonia, magnesia, iron and manganese. Now in medical practice I never give, under any circumstances, any mineral either in the form of a salt, or a compound that does not enter into the human organization, as it would become a foreign substance incapable of assimilation, and therefore poisonous to that extent—or at least a foreign body. On administering an organic substance, or any of the minerals which constitute a part of the human system, there is a provision to discard or eliminate what is not wanted—if in excess of requirements.

But if you give lead or mercury, copper or silver, zinc or tin, there is in nature no arrangement to eliminate it from the system.

Physicians deplore lead or zinc poisoning; why then should they give the salts of either to produce a temporary action, regardless of subsequent effects? Every conceivable drug has been recommended for every known disease, but if the physician would adopt the simple rule I have indicated, he would have the satisfaction of feeling that he had at least done no harm to his patients that would return at some future time to torment him.

J. H. STEARNS, M. D.

Augusta, Maine.

**BROMIDE OF POTASSIUM IN TAPE-WORM.**—An interesting case of tape-worm is reported in the *Buffalo Medical Journal* as being cured, after all the ordinary remedies had been employed ineffectually, by taking bromide of potassium, in twenty-grain doses, every four hours. After continuing the bromide for three days, and taking half an ounce of the spirits of turpentine, and soon afterwards two ounces of castor-oil, a perfect cure was effected. Two hundred feet were passed from the first medicine, and in a few weeks afterward, after repeating this treatment, fifty feet more were passed, at which time the head was voided. Since that time the patient has rapidly improved in health, and has not been troubled with parasites.

**TURPENTINE IN HEADACHE.**—Dr. Warburton Begbie (*Edinburgh Medical Journal*) advocates the use of turpentine in the severe headache to which nervous and hysterical women are subject. "There is, moreover," he says, "another class of sufferers from headache, and this is composed of both sexes, who may be relieved by turpentine. I refer to the frontal headache, which is most apt to occur after prolonged mental effort, but may likewise be induced by unduly-sustained physical exertion,—what may be styled the headache of a fatigued brain. A cup of very strong tea often relieves this form of headache;

but this remedy, with not a few, is perilous, for, bringing relief to pain, it may produce general restlessness and—worst of all—banish sleep. Turpentine, in doses of twenty or thirty minims, given at intervals of an hour or two, will not only remove the headache, but produce in a wonderful manner, that soothing influence to which reference has already been made."

**HASTE AND HEALTH.**—It is not at all wholesome to be in a hurry. Locomotives have been reported to have moved a mile in a minute for short distances. But locomotives have often come to grief by such great rapidity. Multitudes in their haste to get rich are ruined every year. The men who do things maturely, slowly, deliberately, are the men who oftenest succeed in life. People who are habitually in a hurry generally have to do things twice over. The tortoise heat the hare at last. Slow men seldom knock their brains out against a post. Foot-races are injurious to health, as are all forms of competitive exercises; steady labor in the field is the best gymnasium in the world.

Either labor or exercise carried to exhaustion, or prostration, or even to great tiredness, expressed by "fagged out," always does more harm than the previous exercise has done good. All running-up stairs, running to catch up with a vehicle or ferry-boat, are extremely injurious to every age, and sex, and condition of life. It ought to be the most pressing necessity which should induce a person over fifty to run twenty yards. Those live longest who are deliberate, whose actions are measured, who never embark in any enterprise without "sleeping over it," and who perform all the every-day acts of life with calmness. Quakers are a proverbially calm, quiet people, and Quakers are a thrifty folk, the world over.—Dr. Hall.

**CUNDURANGO.**—The Chicago *Pharmacist* gets after the new cancer remedy as follows: It can hardly fail to cause the heart of the American pharmacist to bound for joy to know that Dr. Bliss, from blissful Washington, has announced the blissful intelligence that a cargo of Cundurango has arrived in New York, which will be furnished to the profession at the highest possible prices. "See, the conquering hero comes!" The very name Cundurango has a high and mighty conquering sound—sweetly blended of High Spanish, Guinea Nigger, Fiji, and Whang Doodle. Dr. B. has taken steps to Helmholdize the drug at once. We will soon see it marching on across the Continent, side by side with the other heroic names which, by the magic of paint and cheap blacking, blazoned on every bridge, fence and crag, from the Atlantic to the Pacific, have been stencilled upon the great American heart.

**COLORED CANDIES.**—Some months since a great variety of the candies sold in New York were analyzed by Dr. Endeman, Assistant Chemist to the Health Department of that city, and reported in the *American Chemist*. Reds were either carmine or aniline-red (both harmless). Blues were either niltramarine or Prussian blue (also harmless). Yellows were either saffron, chromate of lime, chromate of baryta, chromate of lead, gamboge, or vegetable colors. Of ten samples five were colored with chromate of lead, and one with gamboge, both poisonous. Greens were harmless, so far as examined. Starch sugar is a common constituent of some kinds of candy, and starch is often substituted for gum arabic. In two cases gypsum was found, 3 and 6 per cent.; no other inorganic adulterations were detected.

**THE SEWING MACHINE AND HEALTH.**—Dr. E. Decaisne has reported to the French Academy of Medicine, as the result of his observations upon 661 operators upon sewing machines, that the injurious effects from using this machine are in nowise greater than are produced by any other muscular effort—only injurious when excessive. The machines with uniform pedals, however, are considered preferable to those alternating. He says that when women use sewing machines within reasonable limits, they are no more injurious than sewing with the needle. In twenty-eight women, between eighteen and forty years, working three or four hours a day, he could discover no ill effects attributable to their labor.

A concise list of "infallible remedies" is given as follows: "For coras, easy shoes; for hile, exercise; for rheumatism, new flannel and patience; for gout, toast and water; and for the toothache, a dentist."

### SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week. 1 month. 3 months. 1 year.  
Per line.....25 .80 \$2.00 \$5.00  
One-half inch.....\$1.00 \$3.00 7.50 20.00  
One inch.....2.00 5.00 14.00 36.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Subscriptions payable in advance.—For one year, \$4; six months, \$3.50; three months, \$1.25. Clubs of ten names or more, \$3 each per annum. \$5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

### San Francisco:

Saturday Morning, Nov. 18, 1871.

### Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, Nov. 15, 1871.—Legal Tenders buying 89½; selling, 90. Gold in New York to-day, 111½.

### Table of Contents.

Standard Stationary Steam Engine—III.; Fog Whistle; Spontaneous Combustion; Loss of Quicksilver.....	305
MECHANICAL PROGRESS.—A Most Important Discovery—If True; Adjustable Car Axles; A Valuable Timber for Piles; Cast Iron Railroads, etc.....	306
SCIENTIFIC PROGRESS.—Vaccination and Disease; Encke's Comet; New Asteroid; To Fix Drawings; Science in Prussia; Albumen Charcoal, etc.....	306
Mines in Eastern Nevada; Mines Near Phillipsburg, M. T.; Silver Star and Iron Rod Districts, M. T.; A Ditch for Mining and Irrigation.....	307
MINING SUMMARY.—Stock & Exchange Board; Market Report.....	308-9
Notices of Recent Patents; Utilizing the Mountains; California Experience in Chicken Raising; Dangers of Coal Mining; English Patent Law.....	310
USEFUL INFORMATION.—Spontaneous Combustion; Paper Clothing; Wooden Nails; Patna Kips, etc.....	311
GOOD HEALTH.—Medical Philosophy; Haste and Health; Cundurango; Colored Candies; Turpentine in Headache, etc.....	311
Our Home Industries; Contributions to Our Cabinet; Mining Discoveries; Annual Report Eureka M. Co.....	312
Miners' and Metallurgists' Companion; Dutton's Improved Harrow—III.; Mining Accidents; New Incorporations; The Water Question.....	313
DOMESTIC ECONOMY; DOMESTIC RECEIPTS; MECHANICAL HINTS; LIFE THOUGHTS.....	314

### Recent Mining Discoveries.

A very superior article of fire-proof clay has been discovered at the base of Ruby Hill, Enreka, Nevada, and will be valuable in building smelting furnaces.

Ledges of gold bearing quartz have been discovered in the mountains east of Visalia.

Rich gold diggings have been struck on the north fork of Thompson's river, British Columbia.

Silver mines have been found east of Ogden, and are said to contain rich argentiferous galena.

Gold mines have been discovered on Rogne River, Oregon, below the mouth of Applegate.

A gold bearing quartz vein has been struck at Tamaroo Bar on the north fork of the American River.

Gold is reported to have been found at Lake Shehandawan in Canada, north of Lake Superior.

**THE WEATHER.—RAIN-FALL.**—A light rain commenced falling in this city on Tuesday evening last, which shortly after changed to quite a copious shower, and continued at intervals throughout the next day. A little over one-third of an inch fell, making six-tenths of an inch in all to the present time, for the season—about equalling the quantity of last year up to this time. The rain was general throughout the State, north of Los Angeles, where, up to Thursday morning, none had fallen, although the indications were then favorable.

### OUR HOME INDUSTRIES.

The foundries in this city are at present unusually busy, turning out mining and milling machinery, gae and water pipe, railroad wheels, and castings for sugar plantations.

#### The Miners' Foundry

are filling large orders for mining machinery throughout California and Nevada, and are making castings for the State Capitol. They have just shipped the iron work for a sawmill on Puget Sound, and have finished an iron tramway, three miles long, for the Arizona mine, at Unionville, Nevada, owned by John C. Fall & Co. The cars on this tramway are carried by an iron wire, and are to convey ore from the mine to the mill. They have also just completed some hydraulic machinery for the Gwin mine in Calaveras. They are engaged in manufacturing water monitors, or distributors, which weigh 1,600 pounds and sustain a pressure of 450 pounds. There is a 13-inch inlet, and five 8-inch outlets, the gates of which are raised by hand wheels and screws. These distributors are in use at Gold Run, San Juan, and by the Dutch Flat Mining Co. They are also making two 25-horse power engines, car-wheels for mining tramways, and machinery for mines in Utah.

#### The Etma Foundry

are constructing machinery for sawing marble, at the fine quarry recently discovered near Colfax, and are fitting up a 16x30 inch steam engine and machinery, for a new cooper shop, which is being built on Brennan street, to take the place of the one lately burned down at the Potrero. They are making an iron front for the Santa Rosa bank at Santa Rosa; and are building a large traveling-crane, with engine attached, to be used in the construction of the new City Hall, in this city. They have just completed a steam-pump, of the capacity of 12,000 gallons per hour, for the Giant Powder Works. They are also doing iron work upon the U. S. Steamer California, and other vessels.

#### The Fulton Foundry

is engaged upon shafting and pulleys, for driving machinery from Scotland, for the the Oakland Cotton Manufacturing Co. They have just forwarded a narrow-gauge steam-engine to the Newport Coal mine, at Coos Bay, and another to Seattle, on Puget Sound. They are also making large retorts for the California Borax Co., at Clear Lake, and are constructing a helix, for a sugar refinery in Central America, and rolls and gears for a sugar mill, to be sent to La Paz. They are manufacturing two large-sized No. 3 Brodie crushers, one for Cross & Co's mine, in Sierra county, and the other for the Union Iron Works, in Sacramento.

#### McAfee, Spiers & Co.

shipped a large quantity of machinery for sugar plantations in Central America, by the last steamer, and have more on hand for the next. They are putting in new chimneys, overhauling the hoilers, and doing other extensive repairs on the steamer Yosemite. They are also making a hoiler for the schooner Mary Taylor, for a wrecking company; and recently forwarded two large boilers for warming the State Capitol. They have ready for delivery two hoilers, 26 feet long, for a sawmill at Crescent City, and have just sent off a fire hox hoiler, for a new steamboat, on the Willamette river, Oregon. They are also overhauling the hoilers and iron work of the harrel factory, recently burned. They have just completed five boilers, for fog whistles. The engines and whistles were made in the East and the boilers are fitted to them here. They are also making a boiler for two fog siren or horns, to be put up at Point Bonita. Further reference is made to these articles in another column.

The Risdon Iron and Locomotive Works are building, for the Crown Point mine,

two of the heaviest hoisting engines ever sent to Nevada. They are turning out a heavy meter case and other work for the Metropolitan Gas Works, and are about finishing a line of pipe for the Spring Valley Water Works. A hoiler is being made for the North Star mine, at Grass Valley, and hydraulic pipe for the La Grange Ditch Company, in Calaveras county. A large quantity of sheet iron pipe was recently sent to Gold City, Colorado, for the City Water Works there. They have just completed the pipe for the water works at the Savage mine. They are also turning out a large number of car wheels for the various railroads, and have a standing order from the Central Pacific, for 50 wheels a week. Work is being done for the Brunswick mill on Cerson river, and car wheels made for the Truckee Railroad.

#### The Pacific Iron Works

are just completing a 10-stamp mill for Frank & Martin, Arizona, and are making pumping machinery for the Yellow Jacket. A large crusher is being built for a mine in Indian Valley, and coal machinery for the Hardy Company, at Coos Bay. Work is also being done for the smelting furnace of the Richmond mine, at Eureka, and large orders have been received, for water and gas pipe from the Spring Valley Water Works, and the Metropolitan Gas Company. They have recently shipped the machinery of a 20-stamp mill for the Schenectady mine, in Monitor, Alpine county. They have also on hand, various orders for machinery from Mexico.

#### Stoddard's Iron Works

have just completed and forwarded two steam pumps to the Rocky Mountain Coal Company, in Utah, another to the coal mines at Bellingham Bay, and one each to the Oneida, North Amador and Original Amador mines, in Amador county. Three of the above are of the vertical patent, which occupies less room in the shaft, and all are fitted with suction hose necessary for sinking. A steam pump is also being fitted up for the Lincoln mine, in Amador county. Stoddard pumps for feeding hoilers at the Savage, Overman, Gould & Curry and Crown Point, have recently been finished, and a steam pump for the Independent Coal Company, at Mount Diablo. They are making a new wrought iron crank for the steam tug Rescue, and are turning out surface condensers for steamship use; also small condensers for making fresh water for culinary purposes on steamers. One of the latter was recently erected at the hospital at Mare Island, and is supplying the invalids with water.

#### Small's Iron Works

are engaged upon shafting and machinery for wood planers. They are also building a newly invented machine for extinguishing fire. This apparatus consists of a telescopic arrangement, by which the fireman is carried up to a considerable height by the motive power of water let in to the machinery from a hydrant or engine.

### Thanksgiving Proclamation by the Governor.

In accordance with a usage which has become national, I hereby appoint Thursday, the 30th day of November, as a day of Thanksgiving and Praise to Almighty God, for the blessings of the past year. Aside from the causes for thankfulness enumerated in the proclamation of the President of the United States, the people of this State have special cause for gratitude, for exceptions from the calamities which have befallen some of our sister States, east of the mountains. The history of nations, the suggestions of reason, and of religious faith teach us that no people need expect permanent prosperity without recognition of the goodness of Divine Providence and a sense of dependence upon His name.

In testimony whereof, I have hereto set my hand and caused the great [L. s.] seal of the State to be affixed at the city of Sacramento, this tenth day of November, A. D. 1871.

H. H. HAIGHT, Governor.  
Attest: H. L. NICHOLS, Sec'y of State.

### Notes on Contributions to Our Cabinet.\*

No. 531.—A number of fossils. These are from the vicinity of Schell Creek, and some of them are characteristic of the Helderburg limestone of New York, particularly the *pentamerous galeatus*.

No. 532.—Fossils from Schell Creek found in shale above limestone.

No. 533.—Silver ore from the Philadelphia mine, on west side of White Pine mountain.

No. 534.—Ore from Silver Bluff, Ruby Hill, Schell Creek.

No. 535.—Silver ore from Silver Bluff, Ruby Hill, Schell Creek.

No. 536.—Specimens from Woodburn, Schell Creek, north mines. Appears to contain melachite.

No. 537.—Ore from Endeavor mines, on west side of White Pine Mountain. Formation granite.

No. 538.—Ore from Bedger State on west side of White Pine Mountain. Formation granite.

No. 539.—Specimen from Silver Chariot, Queen Springs.

No. 540.—Silver ore from San Francisco mine, Schell Creek, Queen Springs; on each side of the main belt; found encased in dolomite.

No. 541.—Ore from Queen City mine, west side of White Pine District.

No. 542.—Ore from Wreath mine, Ruby Hill, Schell Creek.

No. 543.—Very rich piece of argentiferous galena, from Trench mine, west side of White Pine Mountain.

No. 544.—Specimen from Nutmeg mine, Queen Springs, Schell Creek.

No. 545.—Trilobites from east side of White Pine Mountain, found in shale underlying dolomite, near Trench mine.

No. 546.—Croppings from Lookout mine, Ruby Hill, Schell Creek.

No. 547.—Red oxide of copper from Enterprise Ledge, west side of White Pine Mountain. Formation calcareous schist.

The above specimens were kindly sent us by Mr. A. J. Brown.

\*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

### Annual Report of the Eureka Consolidated Mining Company.

The First Annual Report of the Eureka Consolidated Mining Company, showing its financial transactions in detail, and the receipts and expenditures, from the date of its incorporation, July 7th, 1870, to September 30th, 1871, has been laid upon our table.

The mines owned by the company consist of 14 original locations, upon Ruby Hill, Nevada, to eight of which certificates of patent have been received. The extreme length of all the claims is 1,680 feet, and the mean width over 800 feet. The mines have been opened by 10 principal shafts and inclines, one tunnel with side drift and numerous prospect holes. The various shafts and inclines have reached depths of 75 to 170 feet perpendicular. The present ore reserves are calculated at not less than a six months' supply. From Jan. 1st to Sept. 30th inclusive, there were raised from the mines 14,986 tons of ore. The smelting works of the company consist of five furnaces, of the capacity in all of from 120 to 148 tons per day. Number of tons reduced from Jan. 1st to Sept. 30th, 14,591; number of tons of bullion produced during same time, 2,550. Freight on bullion to C. P. R. R. is fixed at \$13.75 per ton. Charcoal costs \$40 per ton, and Superintendent Keyes believes that coke can be made and delivered at the works for \$32 per ton.

The receipts of the company from July 7th, 1870, to Sept. 30th, 1871, was \$1,126, 158.89. Disbursements, including \$225,000 dividends paid to stockholders, \$996,027.60. Balance net earnings over expenditures, \$130,131.29. The resources are \$552,983.09. Liabilities, 378,326.01. Net resource, \$174,657.08. The cost of extracting ore and hauling to furnaces averaged \$5.52 per ton, and the cost of smelting averaged \$19.60 per ton; 18,825 tons of ore reduced, produced 3,468 tons of base bullion, or 5.75 tons of ore produced, one ton of bullion, at a cost of \$35.70.

## THE WATER QUESTION.

By A. B. BOWEN, CIVIL ENGINEER.

(Continued.)

## Lands Bordering upon Large Bodies of Water.

The construction of levees for the protection of lands bordering upon large sheets of water and exposed to the action of waves, is one of the most obstinate problems encountered by the engineer; and is always attended with great expense. The assessment on that portion of the New Jersey meadows, now in process of reclamation, is eighty dollars per acre. Whether this is sufficient or not, remains to be seen.

## Swamp Lands Bordering Upon Tulare Lake.

Levees for the protection of lands bordering upon Tulare Lake, would be exposed to the action of waves, having an unbroken sweep of more than twenty miles; and, during the prevalence of heavy storms, these waves would dash against the levees, like surf on the sea shore. Those levees, therefore, must be enormously strong, and the cost of their construction and maintenance, would probably exceed the value of the land they would reclaim.

A better plan would be to drain the lake by cutting a navigable channel through the transverse swell of alluvial deposit, separating it from the valley of the San Joaquin. This would reclaim not only the swamp land, but a large portion of the head of the lake, and extend steam navigation for a considerable portion of the year, probably more than one hundred miles farther up the valley.

## Tulare Lake as a Reservoir.

It has often been proposed to use this basin as a reservoir for irrigation, and some examinations are now being made with the view of ascertaining whether this be feasible. A great drawback to this scheme, is the shallowness of the basin, and the area of the lake, which is so great that the evaporation from its surface considerably exceeds the average annual influx of water. This is shown by the constant recession of the lake, for a series of years, until an extraordinary flood comes to fill it up again.

To venture an opinion in advance of surveys would be hazardous in the extreme. One thing, however, is certain. The valley of the San Joaquin must be irrigated, even at the expense, if necessary, of countless small reservoirs in the foot hills and mountains. Perhaps the most economical plan, may be, to diminish the area of Tulare Lake as much as possible, by drainage, surround this circumscribed area by heavy embankments, and dam the outlet. This would save a vast amount of water that now passes off by evaporation. Please observe our *perhaps* however, for the expression of an opinion on the meagre data within our reach, would justify our assignment to the State Boarding House in Stockton.

The surveys of which we have spoken, are being made under the direction of R. M. Brereton, C. E., an English gentleman, who is understood to have had experience in hydraulic engineering in India; and it is presumed that his examination will be sufficiently thorough to set this vexed question at rest.

## Lands North of San Pablo Bay.

The Salt marsh along the northern shores of San Pablo Bay, is in many places, hardly covered by the ordinary high tide. A few years ago, during the prevalence of a protracted southeast storm, the incoming tide meeting the swollen waters of the Sacramento river, and of the Sonoma, Petaluma, and San Antonio Creeks, so flooded this land, that a schooner laden with lumber, was carried high and dry, several rods inland over the marsh, which at that time, everywhere offered to the eye, a wide waste of crested waves.

## Embankments

for the protection of this land, should be set back something like a hundred yards from the shore, so that the waves may have an opportunity to exhaust their force before reaching this levee, which at this distance from the shore need not be more than five or six feet high. The soil packs very hard when moist, though it cracks, and, if cultivated, and well pulverized, drifts when dry. The levee should be made broad enough on top for a roadway, the travel over which, without being sufficient to harm the levee, would make it compact and strong.

The diamond said to have been found by the Pinal (Arizona) prospectors proves to be quartz crystals.

## Dutton's Improved Harness.

This new invention is designed to meet fairly all the objections urged against the breast collar harness, and the collar and hames for light driving. We have known of its continued use, both single and double, for over six months; and we can say, from our observation and knowledge of the principles upon which it is constructed, as far as we are able to judge, that it fully meets these objections, and is a really efficient and good harness for the purposes to which light harness is applicable—huggy, express wagon, hack use, and all work lighter than severe heavy draught.

The principal points of the invention are these: the insertion into the breast-strap of a plate of steel with flattened ends, *C*, in the figure, which are so shaped as to fit the lower part of the horse's shoulders even better than the best-fitting collar, and covered with leather, to give the horse a surface sufficiently soft to work against, without danger of chafing, and sufficiently hard to prevent heating and galling. These flattened and covered parts on the sides of the neck are connected by

## DUTTON'S IMPROVED HARNESS.

a bow of steel, *A* (both the sides and the hoisting parts of the same steel plate), which is designed to prevent pressure upon the windpipe and jugular vein, and permit of the attachment of the martingales and pole-strap.

This collar is suspended, by straps, *B*, from a saddle on the withers or back of the horse, which may be either attached to the ordinary saddle as in fig. 1, made part of it, by flattened leather plates to fit under the terrets, as in fig. 2, or may take its place as in fig. 3. The use of this saddle gives the horse greater ease and certainty in holding back, when going down hill, and in supporting the pole, than when the neck has to bear this weight.

The objects to be attained by this improvement are these: Preventing the too common accident of choking-down, and relieving the horse from the distress, in pulling, from pressure on the veins of the neck, inseparable from the use of the breast collar, and perfectly possible in the old-style collar; placing the draft-strain on the sides of the neck, and taking it from across the points of the shoulder, whence the horse pulls at a disadvantage; relieving the neck from all pressure, and the mane from wear; saving the neck from galling and chafing; giving the horse

greater confidence and certainty in holding back, than he can have when that strain is resisted from the neck.

This invention, which has been thoroughly tested before being offered to the public, is expected to drive the breast collar entirely out of use, and also the old-fashioned collar and hames for light driving. It has received diplomas at the late Fair of the Mechanics' Institute in San Francisco, at the State Fair at Sacramento, and at the Fair of the Sonoma and Marin District Society, at Petaluma—the only Fairs at which it has been exhibited; and wherever shown, it has received the warmest encomiums.

All information in regard to this invention, the patent for which was obtained through this office, will be cheerfully given by Mr. John Ashton, Tomales, Marin county, Cal., who is also authorized to dispose of rights for its manufacture and sale.

## Miner's and Metallurgist's Companion.

Our readers will be glad to learn, particularly those who are interested in mining and metallurgical operations, of the advent of a new and useful addition to mining literature, in the shape of a work by J. S. Phillips, well known, both in England and in our own country, in connection with such subjects. The book is called "The Explorer's, Miner's and Metallurgist's Companion," comprising in all 640 pages, and illustrated with some 80 cuts. Published by Dewey & Co., SCIENTIFIC PRESS office.

Many works have been written on metallurgy, and but a few on mining; and these few are more of a general, historically interesting, or statistical import, than of practical value for the daily requirements of miners. Little has been said of the peculiar geology of mineral bearing rocks, or of the indicative features of mineralized sections; less of the underground operations of mining; and nothing of that most effective lever, its mechanical engineering, either above or below the surface.

The author of this work has endeavored, in many instances, to trail new ground, and elucidate departments that have not been so fully exposed as they should have been, and has rather inclined towards the few imperative and better methods, machines and processes, than the more elaborate descriptions of all.

The geological department is written more for those who should fully understand the positions of minerals, than for geological accuracy; intended to create more general and comprehensive ideas of the various formations. The exploration of mineral countries, has been most carefully considered and safely advised.

The chapters on the comportment and peculiarities of mineral veins, are derived from observations made during the many years' experience of Mr. Phillips, and contain some records of value to the amateur. The section on assaying and discrimination of minerals, embraces many varied and more available methods for practical men and amateurs; so that, one facility being absent, another will be found present. In the commercial methods, the more direct, less mystified and least dangerous means and fluxes have been selected.

In mining and engineering, the best plans of operation and machines have been extolled, and the most common errors of the past exposed, as besacons for avoidance. The illustrations are more particularly inserted for the better explanation of novelties introduced, than for reproduction from other works.

In the metallurgy of the volume, just sufficient has been selected from the best modes for rendering the ores of remote countries more profitably marketable, with the least possible study of this complicated business.

Particulars as to price, headings of chapters, etc., may be had by reference to advertisement in another column.

## PATENTS &amp; INVENTIONS.

## Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

## FOR THE WEEK ENDING NOVEMBER 7.

GATE.—David Creighton, Vacaville, Cal. PUMP.—John Marquis, San Francisco, Cal. STOP-COCK.—Jacob Radston, San Francisco, Cal.

ROASTING AND TREATING ORES.—John W. Bailey, San Francisco, Cal.

FURNACE FOR ROASTING ORES.—John W. Bailey, San Francisco, Cal.

MEDICAL COMPOUND FOR THE CURE OF RHEUMATISM.—Charles F. Washburn, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible by telegraph or otherwise at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

## Mining Accidents.

Wm. Sharp, of Nortonville, 24 years of age, lost his life, on Thursday of last week, through inhaling foul gas, in the Brentwood mine, at Marsh Ranch. Another miner, named O'Strander, was rescued when nearly exhausted, and subsequently recovered.

A miner named Wm. Merritt, working in the Coe mine, near Grass Valley, was badly crushed last week, by a cave in the mine.

Two men, named Andrew Wilson, a native of Cronstadt, Russia, aged 35 years, and John Beckley, a Cornishman, 24 years of age, were killed a few days since in the Belcher mine, by being thrown down the shaft, by the unexpected starting of the cage.

This pinion wheel of the hoisting works of the Illinois mine, in Colorado, gave way recently, precipitating a load of two tons to the bottom. Fortunately no one was injured.

John McNallis, a miner at the North Star mine, at Grass Valley, was severely hurt, by a mass of dirt and rock falling upon him. Wm. Cleghorn, a miner on Nevada Creek, was caught by the falling dirt in a drift, and was found alive after five days and a half. His hip was dislocated, and his right leg fractured.

## New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

STATE INVESTMENT INSURANCE Co.—Capital stock \$500,000, in 5,000 shares. Trustees: T. Curtis, A. J. Bryant, P. Donahue, F. M. Pixley, C. D. O'Sullivan, E. Burke, J. H. Saunders, J. W. Nye, J. Middleton, H. Whittell, C. H. Cushing, A. Austin, J. Rosenfeld, T. N. Cazneau, and J. J. Marks.

FORMAN MINING Co.—Capital stock, \$5,000,000 in 50,000 shares. Trustees: C. Forman, R. F. Morrow, and A. E. Head.

MERCEN AND SAN JOAQUIN IRRIGATING Co.—Capital stock, \$1,000,000 in 10,000 shares. Trustees: J. McPike, G. D. Roberts, R. Gibbons, J. B. Haggin, and B. B. Winn.

DUTCH FLAT BLUE GRAVEL MINING Co.—Capital stock, \$4,000,000, in 40,000 shares. Trustees: L. A. Booth, J. B. Haggin, E. B. Dorsey, G. D. Roberts, and W. H. Raymond.

SACRAMENTO VALLEY CENTRAL CANAL Co.—Capital stock, \$10,000,000, in 100,000 shares. Trustees: J. M. Gregg, G. R. Lowe, and W. P. Dangerfield.

The following have filed certificates with the County Clerk, Sacramento:

HUTCHICK WATER Co.—Capital stock \$50,000.

THE BABCOCK FIRE EXTINGUISHER.—An experiment was made with the Babcock Extinguisher on the Pacific Steamship wharf, on Tuesday last, in the presence of a large number of insurance men and captains of steamships and others. The experiment was highly satisfactory as to its merits and great practical value.

Cold weather has set in in Nevada, and ice forms in Gold Hill and Virginia City nightly. Carson river was frozen over lately.

Considerable snow has fallen in Utah. The roads to the Cottonwood Districts are kept open with difficulty.

## DOMESTIC ECONOMY.

### Softening Water for Household Purposes.

EDITORS PRESS:—In many parts of California the "hardness" of the water is a constant source of trouble and vexation to housekeepers. It is frequently unfit for culinary purposes, and it is the exception to the rule to find good washing water. Most families, therefore, resort to sal-soda, borax, concentrated lye, or to the various washing fluids advertised for sale to "soften" (or "break," as the washmen call it,) the water before washing clothes, gaining thereby a saving in labor and soap, which is, however, more than counterbalanced by the destruction of the fabric of the garments washed.

Your correspondent has been "keeping house" in this State, in various places, nearly ten years, and has experimented with all sorts of washing powders and fluids, and has found the objections stated above applicable to them all. He has recently, however, been using a modification of Dr. Clark's process for softening water, with such satisfactory results that he sends it for publication that others may benefit by his experiment.

The "hardness" in water is generally caused by its holding in solution a salt of lime, most frequently in the form of bicarbonate of lime. When soap, which is a compound of an alkali and an oily acid, is added to the hard water, the lime decomposes it and combines with the oily acid to form a lime soap, which is insoluble and has no cleansing properties. Now every grain of bicarbonate of lime dissolved in water decomposes ten grains of soap; water, therefore, which contains, for example, 20 grains of lime salt to the gallon, will destroy 200 grains of soap; in other words the first half ounce of soap added to a gallon of water of this degree of hardness, will disappear without forming a lather or having any cleansing effect. Clark's process for softening water is based upon the principle that carbonate of lime, which is but sparingly soluble in pure water, dissolves readily in water containing carbonic acid forming a bi-carbonate, and that when a solution of caustic lime is added to such water, it takes part of the carbonic acid away from the bi-carbonate and reduces the whole to the form of an insoluble carbonate of lime or chalk, which falls down "taking along with it in a sort of net work other mineral salts as well as some organic matter."

Various methods have been suggested to adapt this principle to practical use, most of which require expensive machinery or a heavy outlay for tanks and reservoirs. The plan in use by your correspondent is cheap and easily followed.

The only apparatus required is two common barrels, placed on end, with their heads removed and fashioned into covers. Into one of these is placed about half a bushel of unslacked lime; it is then filled with water and briskly agitated for a few moments and the undissolved lime permitted to precipitate, when the supernatant liquid becomes clear and transparent.

Then fill the other barrel with this clear lime water, and common hard water in the proportion of one huckful of the former to eight or ten of the latter, (placing all the lime water in the barrel first), and stir briskly for a few moments. The clear liquid soon becomes turbid. A white cloudy precipitate of insoluble carbonate of lime forms and gradually falls to the bottom of the vessel, leaving the water transparent as crystal and soft as rain water. It is excellent drinking water, and makes splendid tea, and for laundry purposes leaves nothing to be desired. It makes a lather easily, and clothes washed in it are white and pure without the expenditure of half the amount of soap required by the same water before the precipitation of the chalk.

Of course the proportion of lime water to common water given above will vary with the degree of hardness of the water in any given locality. This can only be determined by experiment, the degree of hardness being gauged by the quantity of soap required to be added before a lather is produced.

When the barrel of lime water is exhausted it is only necessary to add more water to the same lime, as it can be used over and over again.

W. W. H.

### Apples in Cooking.

Julia Colman, in the *Rural New Yorker*, in speaking of the various uses to which apples may be applied, says:

A broad field where apples come in when milk and eggs go out, lies in the range of puddings, a style of dishes hitherto very largely dependent on milk and eggs. And first, we will take the simplest, a bread pudding. Steep your apples gently in a moderate amount of water, and sweeten to the taste. If wanted very nice, strain through a colander. Cut bread in slices one-third of an inch thick. If hard, steam it. Put in an earthen pudding dish a thin layer of stewed apples, and then a layer of bread, until the dish is filled, finishing off with the fruit. Some like more apples, others less. Bake about 40 minutes. This is very plain. It can be improved by moistening the bread in a preparation of one part lemon juice and four or five parts water, sweetened to taste; and by scattering on the surface of each layer of apples, a few nicely washed Zante currants, or seedless raisins. Or apple and grape, apple and quince, apple and cranberry may be used, always stewed.

Another series of puddings can be made with uncooked chopped apple mixed with equal quantities of cooked pearl-barley, or cracked wheat or hominy. To one pint of each of these ingredients add one gill of sugar, and, if you wish it, one-half pint of stewed raisins or Zante currants, and the juice of one lemon, (with two spoonfuls more of sugar to sweeten it;) mix thoroughly, and bake an hour or more.

A very simple crusted pudding may be made by filling an earthen pudding-dish with spiced apples, and spreading over it, thickly, a batter crust made by stirring wheat meal into cold water until the batter is just too thick to settle flat. Bake 30 or 40 minutes, then loosen at the edges, invert on a plate, mash and sweeten the apples, cut in pie-quarters, and serve. Instead of the batter crust, pour boiling water into wheat meal and stir lightly, making a dough just firm enough to roll out; make it one-third of an inch thick, spread over the apple, and bake 30 minutes, or until the apples are tender; invert and serve as above.

A cocoa-nut pudding, more delicate than any of the above, is made with two-thirds grated apple and one-third grated cocoa-nut, sweetened to the taste, and a very little grated nutmeg, one-third of a teaspoonful to a quart of pudding, just enough to flavor it, without giving the "tang" of the nutmeg. This is the proper way to use flavors when used at all. The result will be there, and evident, though the partaker may not be able to trace its origin. Bake this pudding half an hour. Stewed apple may be mixed in equal quantities with scalded sago or soaked tapioca, with currants, stewed raisins, or seedless raisins to the taste. Sweeten and bake 40 minutes. Or stuffed and cored apples with the raisins from the soaked and sweetened tapioca, or sago and apple over them; bake till the apples are tender, and you have a showy and delicious *bird's-nest pudding*. But these puddings are very good without the "bird's-nest," and they are very convenient to make with canned apples, after the fresh apples are gone.

### Effect of Keeping Flour in Barrels.

As is well known, flour kept in barrels for a long time often acquires a peculiar odor, supposed to be derived from the barrel. Professor Poleck, of Silesia, has lately made a careful examination of such flour, and has ascertained that this smell actually indicates an incipient decomposition prejudicial to bread-making, the gluten of the flour having in part become changed into a soluble body. Thus, while sound flour, preserved in sacks contained 11.06 per cent. of gluten and 1.44 per cent. of soluble aluminous matter, four other specimens of flour taken from different barrels were severally composed of 8.37 per cent. gluten to 2.14 per cent. soluble albumen; 7.40 per cent. to 6.90 per cent; 7.23 per cent. to 4.44 per cent.; and 6.54 per cent. to 6.46 per cent. Two samples with more than 6 per cent. of soluble matter had an acid reaction, while the others were neutral. Professor Poleck believes this chemical change of the flour to be induced by the fact that the barrel prevents communication with the atmospheric air and the equalization of temperature. This view is confirmed by the oft-repeated observation that flour in sacks keeps fresh for a much longer time, and that the mustiness in barrels always develops first, and exists in the highest degree in the center, viz., that portion most remote from the outer air.

### Domestic Receipts.

#### Good Recipes for Soup.

**OYSTER SOUP.**—Three quarts of opened oysters; three pints of milk. Boil the oysters in their own liquor, with a very little powdered mace, cayenne pepper, and a piece of butter the size of an egg. When the oysters have become plump, add the milk; this must be done carefully to prevent curdling, and thicken the whole with powdered and sifted cracker. Many prefer this soup without using thickening.

**GREEN PEA PUREE.**—Soak one quart of peas in boiling water for an hour. Take them out and put them in fresh boiling water to cook, with a pinch of salt, and a bit of celery, if procurable. When well cooked mash them and rub through a sieve. Put in a piece of butter half the size of an egg, and a very little pepper and a pinch of salt and half a pint of cream, and warm up for the table. All purees are better for a foundation of beef-steak.

**PUREE OF SQUASH.**—Cut the squash or pumpkin into small pieces, and stew it with a little salt. Rub it through a sieve, and make it like "green pea puree," with butter, cream, pepper and salt.

**PEA SOUP.**—Soak a quart of peas in lukewarm water for three hours; pour off the water and boil in three and a half quarts of water well salted, until the peas are thoroughly soft. Then strain through a colander and throw the peas away. This will keep several days in cool weather. When used, take out the needful quantity, boil it with a bit of pork partially cooked, an onion, a pinch of salt and pepper, and serve hot with squares of toasted bread floating on top.

**TURTLE BEAN SOUP.**—Take a quart of black beans; wash them and put in a pot with the usual quantity of water, and boil until thoroughly soft. Dip them out and rub the pulp through the colander, and return it to the liquid in the pot. Add some thyme in a clean cloth, put it into the pot and let it boil a few minutes for flavor. Slice some hard-boiled eggs and drop them into the soup. Add a little butter, pepper and salt. Some people like a little wine, and a slice or two of ham at the bottom of the tureen.

#### Mechanical Hints.

**STAIN FOR NEW OAK.**—A correspondent, who objects to the use of lime water as a stain for oak, on the ground that the color produced, though good at first, becomes in two years of foxy red, says: For new work, especially church work, let no oil, no ash, come near it, but wash it with hot beer, and rub it well; the grain will show admirably, and time will mellow it down to a tone which never could be acquired if it had been previously doctored.

**DRY ROT OR WORM IN FURNITURE.**—A Berlin cabinet maker says: Take equal parts of paraffine and linseed oil; saturate the same; that will stop their work. If the articles are exposed to an airy place for a few days it will dry, and the smell will go off. I have used the same to advantage.

**MULTUM IN PARVO.**—W. Z. Cooke, of Birmingham, England, has invented a mode of constructing a table, bed, child's rocking cot, settee, folding chair, drawers and press, in such a manner as to be combined together, wholly or partially, so as to be used when desired, and capable of being folded up into small compass.

**AN OLD STEAM-ENGINE.**—The Spanish cinabar mine of Almaden, is one of the last places one would expect to find one of Boulton & Watt's original engines, but it appears that one was erected there in 1799, and has been at work ever since.

MANY mechanics complain of inability to set a machine to be driven at right angles from the line or counter-shaft, without continual trouble with friction from the shifter on the belt, and the slipping of the belt to the tight or loose pulley. The operation is a simple one, and just as effectual as to drive in a direct perpendicular or horizontal. Take the center of the off or contributing side of your drive pulley and drop it on a plummet; let this line decide the center and perpendicular of the side of the tight and loose pulleys which takes your belt at a right-angle below. Unless your eye is accustomed to the angles which are given to the appearance of the belt, from either side, you will condemn the position without trying, but if you are careful to get an exact perpendicular in the manner described there can be no mistake.—*American Manufacturer.*

## LIFE THOUGHTS.

**HOLD ON.**—Hold on to your tongue when you are just ready to swear, or speak harshly, or use any improper word.

Hold on to your hand when you are about to strike or do any wrong.

Hold on to your feet when you are on the point of kicking, or running away from study, or pursuing the path of error, shams, or crime.

Hold on to your temper when you are angry, excited, or imposed upon, or others angry about you.

Hold on to your good name at all times, for it is much more valuable to you than gold, high places, or fashionable attire.

Hold on to the truth, for it will serve you well, and do you good throughout eternity.

PROVIDENCE has a thousand keys, to open a thousand doors, for the deliverance of his own.

It is grateful to see the clear shining of the sun after a rain. It is not a change from truth to falsehood which men need, but from one form of truth to another.

POLITENESS is but kind feeling toward others, acted out in our intercourse with them. We are always polite to those we respect and esteem.

TRUST him little who smilingly praises all alike; him less who cheerfully censures all alike; him least who is coldly indifferent to all alike.

It is more from carelessness about truth, than from intentional lying, that there is so much falsehood in the world.

THE way to get rid of doubts in religion, is to go to work with all our might and practice what we do not doubt.

STRIVE after an equal tranquility of mind on all occasions and in all circumstances. Strive to get accustomed to this frame.

ENERGY will do anything that can be done in this world; and no talents, no circumstances, no opportunities, will make a man without it.

### Keep Your Eyes Open.

Two teachers may be standing before the same class, one will merely be aware that there is a general disorder and noise throughout the room, without being able to identify any particular scholar as transgressing.

The other will notice that James is talking, that William is pulling his neighbor's hair, that George is munching an apple, and so on. The difference in the two is that one's mind is awake and he sees all that is going on, and knows first where, when, and how to stop it. It therefore becomes every teacher to constantly have his eyes open, and to see all that is being done. A man's mind must be awake. In fact this is the secret of the whole matter, for the more the face and eyes are quiet and the mind is on the alert, the more will a man see. Seeing is rather a mental than a bodily act, though of course the bodily organ is necessary to its accomplishment. Wherefore to be a good observer, we have learned that one must maintain a quiet and composed demeanor, but be thoroughly wide-awake within.

**GRAVES.**—What unconscious tribute we pay to the doctrine of the resurrection, by the love and honor in which we hold graves, century after century. Surely, in our hearts we believe that each such spot becomes forever unlike all other ground; by whatever process the dear flesh crumbles, returns to dust, and is changed into the leaf, flower, and seed that perish in our hearts, we believe that the grave remains a grave, and that at least this much is sure; that the happy, soaring, growing spirit, which has gone to a world above, will never forget where the tiny spot is on this one, in which its human body was laid.

**THINK.**—Do your own thinking. Yes, that is the idea. Think for yourself. It is well to listen to the expressed thoughts of others, and it is an agreeable pastime to give expression to your thoughts. But when alone, weigh what you have said, and traverse what you have said. It is well to do this, for it will assist in curing you of false notions, and in eradicating unprofitable and vicious ideas, and in time make you better men and women. What you thus gain from surroundings, you will unwittingly transmit to the rising generation, and the result will be that you will do your share in the glorious work of elevating the human family. Do your own thinking.

STEPHENS & CO.,

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.

The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.

In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and NUMBER OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.

"By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form."—Scienti-  
fic American.

entific Press, San Francisco. cc28-1m

## DIRECT TESTIMONY.

TOMALES, Marin Co., Cal., Oct. 28, 1871.

MESSES. DEWEY & Co.—Gentlemen:—We are happy to acknowledge the receipt this day of Letters Patent, No. 120,049, for "Dutton's Improved Harness," and dated October 17, 1871. At the same time, we desire to acknowledge, with thanks, your promptness and certainty in obtaining this patent. A very prominent New York firm, of great reputation, to whom this matter was intrusted at the start, in two and one-half months got the matter so far along that we received a notification that our claim was rejected, on grounds of pretended interference this most frivolous and nonsensical, and too clearly showing that they were interested in having an "appeal" prosecuted at our expense and for their benefit. Not being fascinated with the disposition to receive without rendering an equivalent, the matter was intrusted to you, and in two weeks a notification was received that the claim had not been properly presented and that it was valid and would be allowed. We were enabled then to proceed with the invention with some degree of certainty. In less than a month you had the claim passed for issue. Your method of conducting the business merits our warmest praise; and so long as your firm acts upon the same scale of fairness and promptness as shown in our experience, you may rest assured that all our patent business will pass through your hands. We are, yours truly, DUTTON & ASHTON.

## Special to Inventors.

All inventors who secure valuable patents through the SCIENTIFIC PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are more favorable to Pacific Coast inventors than those of any other Agency in the United States, besides the benefit derived from having their inventions set forth rightly in the start by gratuitous publication in more than one highly reputable journal.

MESSES. ORO, P. ROWELL & Co., the celebrated and popular New York Advertising Agency, engage to advertise in gross and detail for large customers in a better and cheaper mode than they can do it themselves. This we sincerely believe they can do, because it is their sole business—their specialty; because they get space at lowest wholesale rates, and because of their intimate and confidential relations with publishers. If we wish to spend ten thousand dollars in general advertising over the country, notwithstanding our own experience and knowledge of advertising styles and of rates, we would employ them under certain directions. We would save money, trouble, worry, and the business would be done at least as well, if not better, than we could do it ourselves.—*American Manufacturers' Review and Pittsburgh Price Current.*

VALUABLE AND RELIABLE.—"BROWN'S BRONCHIAL Troches" will be found invaluable to those exposed to sudden changes, affording prompt relief in cases of Coughs, Colds, etc. For Public Speakers and Singers, and those who overtax the voice, they are useful in relieving an Irritated Throat, and will render articulation easy. As there are imitations, be sure to obtain the genuine.

Opera Glasees, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

READERS will favor advertisers by mentioning the information gained from notices in our paper.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

## THE

## QUARTZ OPERATOR'S HAND-BOOK,

BY P. M. RANDALL

REVISED AND ENLARGED EDITION.—1871.

## CONTENTS:

APPLIED MECHANICS—Thin Cylinders, Thick Hollow Cylinders, Relative Grinding Capacity of differently formed Grinding Plates, Friction, Water Pipes, Velocity of Streams, Water Power, Water Wheels, Steam Power, ASSAY—Mechanical Assays, Dry Way of Assay, Humid Way of Assay, Assay or Analysis of Iron Ores containing Manganese, Assay or Analysis of Ores containing Gold, Silver, Copper, Lead, Iron and Sulphur. BEHAVIOR OF SOLUTIONS OF METALLIC OXIDES WITH REAGENTS—BLOW-PIPE—EXAMINATION OF MINERALS. GOLD—Treatment of Ore Containing Gold: By Smelting; By Amalgamation; By Chlorination. MILL—STAMP—SILVER—GOLD. MINERAL VEINS—Species of, Formation of, Exploration of, Exploitation of. MIDS—VENTILATION OF. QUARTZ MACHINERY—Rock Breakers, Batteries, Mortars, Tappets, Gams, Cam-Shafts, Stamps, Dies, Screens, Guides, Grinders and Amalgamators. Wheeler & Randall's Excelsior Grinder and Amalgamator. Separators. Wheeler & Randall's Conoidal Separator, Concentrators, Wheeler & Randall's Eureka Concentrator. The Wheeler and Randall Tumble Copper Concentrator and Amalgamator. Retorts, Gold Retorts, Silver Retorts, Crucibles, Ingot Molds. REDUCTION AND CONCENTRATION OF ORES—DRY WAY. ROASTING—Heaps, Furnaces. SMELTING. SILVER—Ores of Silver, Treatment of Silver Ores: By Smelting; By Solution; By Amalgamation. Extraction of Silver from Silver from Chuse Copper, Extraction of Silver from Copper Matte, Sodium Amalgam, Purification of Mercury, Quicksilvering of Copper-Plate, Cupellation of Gold and Silver, Refining of Gold and Silver.

Sold, Wholesale and Retail, at publishers' rates, by DEWEY & CO., Proprietors SCIENTIFIC PRESS, Patent Agents, Engravers and Publishers, San Francisco. Cloth bound, 175 pages. Price, \$2.

MOTT, FISH & CO. .... Main street, Hamilton, Nev.

The King of Mineral Springs is the German Seltzer, and

Tarrant's Effervescent Seltzer Aperient

is its duplicate. Letters attesting its wonderful Tonic and Anti-Bilious qualities swarm in from every source. The question has been settled whether artificial medicated waters may not be equal to those which burst sparkling from the earth itself. They can; and the Seltzer Aperient, when undoubtedly pure and genuine, proves the fact. Be cautious. Accept none other.

SOLD BY ALL DRUGGISTS.

## AMMONIACAL PREPARATION

—FOR THE—

## Prevention and Removal of Boiler Scale.

MANUFACTURED BY THE

San Francisco Gas Company.

F. I. CURRY, Sole Agent, San Francisco Boiler Works, 123 and 125 Beale street, San Francisco.

This Preparation is proved by the experience of many of our best machinists and engineers to be a perfect cure for the vexatious and dangerous incrustation known as Boiler Scale. It is sold in 5-gallon cans at \$5.25 per can, or in cases of two cans each at \$10.50 per case.

The San Francisco Gas Company also manufactures

Carbonate of Ammonia.

Muriate of Ammonia.

Sulphate of Ammonia.

Liquor Ammonia, Concentrated.

Aqua Ammonia, F. F. F.

Concentrated Crude Ammonia, for Ice Making and other manufacturing purposes.

The most Complete ever Written for the Pacific States.

## The Explorers', Miners'

—AND—

## Metallurgists' Companion,

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

BY J. S. PHILLIPS, M. E.

JUST ISSUED BY DEWEY & CO., PUBLISHERS SCIENTIFIC PRESS, S. F.

[Printed and published only on the Pacific Coast.]

Contains 640 pages, illustrated with some 80 engravings.

A Profitable Instructor for Prospectors, Miners and Metallurgists throughout the world.

Treating on the following subjects:

Geological Formations of the Primitive Earth, its Secondary Rocks, its Mineral Veins, Minerals, Metals, Coal Fields, Etc., Etc.

General Composition and Peculiarities of Mineral Veins; Their Comportment with Each Other, and with Cross Courses, Dikes, and Slides.

Geological Characteristics of the Most Extensive Mining Districts.

Exploration for, and Examination of, Mineral Veins. Discrimination and Assay of Minerals, by the Most Available and Practical Methods.

Mining and Mechanical Engineering, Above and Below the Surface, for Dressing of Ores, Deep Mining, Etc.

Assorting, Crushing, and Concentration of Ores.

The Best Methods for Reducing the Minerals and Metals to a Marketable Condition, by Roasting, Milling, Chlorinizing, Smelting, and by Chemical Treatment.

The Continually Recurring, Unnecessary Errors, in Mining and Metallurgy.

Prior, bound in cloth, \$10 (in coin or its equivalent).

In leather, \$12. Postage, 50 cents extra. Address all orders (wholesale or retail) to Dewey & Co., Scientific Press, 338 Montgomery street, San Francisco.

## J. S. PHILLIPS, M. E.,

Examiner of Mines, Consulting Engineer,

Mineral Assayer, Analyst, Etc., Etc.

423 Washington street.....San Francisco

Author of "The Explorers', Miners', and Metallurgists' Companion."

Inventor of the Explorers', Miners', Millers', and Smelters' Friend, the Prospectors' "WEE PET" Assaying Machine, etc., which obtained a Gold Medal at the San Francisco Mechanics' Institute Fair of 1869.

Patented September 7, 1869.

Arranged for the general purposes of the Analyst and Assayer.

Price, with instructions, tools and fluxes, \$100.

Practical Instructions in all kinds of Assaying, Discrimination and Analysis.

20-v23-tf

## SANBORN &amp; BYRNES,

South Point Mills, Berry Street,

Between Third and Fourth, San Francisco. Orders from the country promptly at tended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners Billiard Balls and Ten Pins. Fancy Jewels and Balusters.

21v22-6m.

JOHN B. MORROW,

Machinist and Model Maker.

Patent Office Models made with neatness and dispatch at Reasonable Rates. 247 Fourth street, San Francisco. 18v23-tf

## The Best Bedstead Fastening!

BARLOW'S PATENT, 1871.

## Repair Your Bedsteads!

By employing this new California invention, which is bound to supercede all other Fastenings. They are made of Wrought Iron, by machinery, and are easily applied quickly operated (as may be seen by the above illustration), and never break or wear out. Don't bother any longer with rickety bedsteads, but buy these fastenings and apply them yourself, or send to the inventor, who will repair any kind of bedsteads at reasonable rates. Examine this patent device, and, with the best workmen in the city, you will declare it to be the best and only perfect Fastening. Orders received at my shop, corner of Sixteenth and Harrison streets, or at 320 Kearny street, Room 5.

19v2-tf-sa

E. T. BARLOW, Patentee.

## THE IMPROVED

## AMERICAN VAPOR STOVE.

No Wood, Coal, Smoke, Ashes, Stovepipe nor Chimneys, and Perfectly Safe. Economy and Convenience combined.

WILLIAM FRIEL, Manufacturer,

No. 69 and 71 Fourth street, S. F.

All kinds of Lamps altered to burn Patent Oil with or without chimneys. Gasoline and Patent Oils for Stoves and Lamps for sale. County Rights for sale. 10v23-3m

## The California Powder Works

No. 314 CALIFORNIA STREET. SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

## Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

## HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m

JOHN F. LOHSE, Secretary.

## SELF-OILERS.

## WATERS' SELF-OILERS.

lubrication on loose pulleys and all kinds of bearings. Any kind of Oil in any kind of weather. Price, \$4.50 per dozen. Liberal discount to agents and to the trade.

WATERS & CO., no18-3m 164 Elm st, near Fourth, Cincinnati, Ohio.

## CAUTION.

## BETTS'S CAPSULE PATENTS

are being infringed by importation of Capsules made in contravention of his rights, which necessarily are numerous. BETTS being the original Inventor and Sole Maker in the United Kingdom.

Mining and Other Companies.

In the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—hence in the very latest hour we can receive advertisements.

**Altona Gravel Mining Company—Location**  
of works, Grass Valley, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of October, 1871, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary, at his office in San Francisco. Any stock upon which said assessment shall remain unpaid on the 4th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 26th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, **DAVID WILDER, Secretary.**  
Office, No. 24 Merchants' Exchange, California street, San Francisco, Cal. nov-15w

**Eagle Quicksilver Mining Company—Location**  
of works, Santa Barbara County, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of October, 1871, an assessment of Forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 3, No. 302 Montgomery street, San Francisco, Cal. Any share upon which said assessment shall remain unpaid on Thursday, January 4th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, **WM. H. WATSON, Secretary.**  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. nov-15w

**Kearsarge Mining Company—Location**  
of works, Kearsarge District, Inyo County, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of October, A. D. 1871, an assessment of five (\$5) dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room No. 10, Express Building, northeast corner of California and Montgomery streets, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday, the 26th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 26th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, **JON. L. KIN, Secretary.**  
Office, Room No. 10, Express Building, northeast corner of California and Montgomery streets, San Francisco, California. nov-15w

**Office of the Noonday Silver Mining Company—Location**  
of works, White Pine Mining District, White Pine County, State of Nevada.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of October, A. D. 1871, the several amounts set opposite the names of the respective shareholders, as follows:

**Ophir Copper, Silver and Gold M. Company—Location**  
of works, Ophir, Placer County, Cal.  
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23rd day of October, 1871, an assessment of sixty (60) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, R. G. Brush, Office, No. 314 California Street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 25th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 18th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, **R. G. BRUSH, Secretary.**  
Office, 314 California Street, San Francisco, Cal. nov-15w

KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma  
Over all Competitors, at Mechanics' Instituto Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.  
The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.  
The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.  
The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

**CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,**  
SACRAMENTO, CAL., April 14, 1871.  
A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.  
Yours truly,  
**A. J. STEVENS, General Master Mechanic.**  
**OFFICE OF PEOPLE'S TRANSPORTATION CO.,**  
PORTLAND, OREGON, April 22, 1871.  
Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.  
Yours respectfully,  
**G. MARSHALL, Chief Engineer.**

**OFFICE OF N. Y. CENTRAL R. R., ALBANY, JUNE 3, 1871.**  
Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.  
Yours very truly,  
**C. P. HARM.**  
**OFFICE OF DELAMATER IRON WORKS, NEW YORK, MAY 26, 1871.**  
Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.  
Yours very truly  
**GEORGE M. REYNOLDS, Supt. Engineer.**  
**U. S. NAVY YARD, NEW YORK, JUNE 3, 1871.**  
Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.  
Yours very respectfully,  
**WM. W. WOOD.**

**OFFICE OF THOMAS IRON WORKS, HOKENDAUQUA, Pa., JUNE 1, 1871.**  
Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "This Knowles Pump" to any who may have use for a first-rate Steam Pump.  
Respectfully yours, etc.,  
**EDWIN MICKLEY, Supt. of Mines.**  
**OFFICE OF THE SAUCON IRON CO.,**  
HELLERTOWN, NORTHAMPTON COUNTY, Pa., May 26, 1871.  
Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnaces and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given very great satisfaction, and that we like them better than any we have ever used.  
Yours very respectfully,  
**G. W. WHITAKER, President and Superintendent.**

**OFFICE OF NEW HAVEN WATER CO., DEC. 18, 1869.**  
Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.  
Yours very truly,  
**P. SAULT, Superintendent.**

**OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, JUNE 11, 1871.**  
A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc.,  
**JOHN CLEMENTS, Engineer.**

WE BUILD AND HAVE CONSTANTLY ON HAND  
THE LARGEST STOCK OF PUMPS IN THE WORLD,  
And for Every Conceivable Purpose.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the election of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and O.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

## THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

## IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

## DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.  
For further particulars address

FURMAN R. WILSON,  
San Francisco.

## Longshore's Combination Tool.

This device is just what its name indicates. As a KITCHEN Tool, it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nail Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

CAST IRON PIPE,  
FOR WATER AND GAS.

PIPE of all sizes, of a very superior quality, is now being made at the  
Pacific Iron Works,  
In this city, under the Patents of Farrar & Whiting.  
17v23-3m GODDARD & CO.

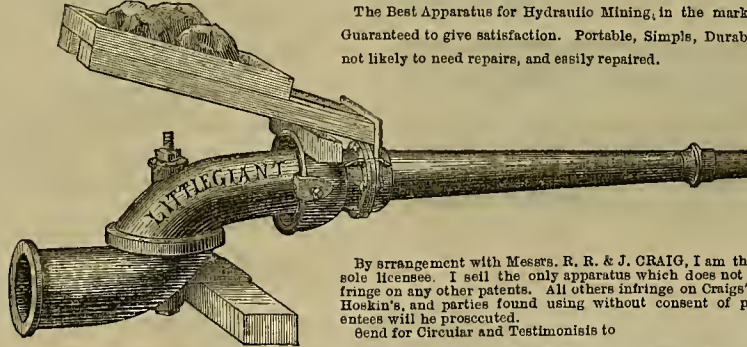

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a large charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.  
It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.  
Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.  
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.  
This Amalgamator Operates as Follows:  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.  
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

## Ambler's Blowpipe Furnace.

Our illustration represents an improved furnace for smelting and roasting ores, invented by Stephen F. Ambler, of Monitor, Alpine Co., Cal. The main principle in this furnace which differs from those of ordinary construction, is that a stream of heated air is passed into the ore without any loss of oxygen by combustion, and that the wood is converted into charcoal before it reaches the fires, to be used as fuel. These are two important points. Generally when air is introduced it passes through the fire, thereby losing a large proportion of its oxygen; by the use of this furnace all of it is utilized, from the fact that it is merely heated, not burned. This excess of oxygen prevents concentration or melting of the sulphurets in the cylinder, another point of great importance. When the ore contains a large proportion of sulphurets, the heated air may be passed over it by means of the blower and pipes and they may become more completely oxidized, whereas if only a small proportion of sulphurets are present, the air can, by means of the dampers, be turned under the grate into the fire. These drafts can be regulated at will to throw either all, or a certain proportion of, the air in the direction required, either into the fire or the revolving cylinder containing the ore, according to the class of ore under treatment. In order to explain this more fully reference is made to the accompanying cuts, of which Figure 1 is a side elevation, and Figure 2 a plan.

A, represents the furnaces, constructed of brick in the usual manner of furnaces, which is provided with a grate over the lower door and above which is the carbonizing chamber, E. This chamber is kept constantly filled with wood which is fed through the upper door, C. When the doors, C and D, are closed, the wood in the upper part will be carbonized or converted into charcoal, and, as the fire below burns out, the charred or carbonized wood will settle down and continually feed the fire. At the back of the chamber, E, is a hot air chamber, F, into which the heat, gases and flame from the chamber, E, pass through the flue, g. A blast pipe, h, enters the chamber, F, at about an equal height with the flue, g, while a branch pipe, i, passes to the front and enters the chamber, E, so as to deliver its blast directly under the fire in the grate. The blasts from these pipes are regulated by dampers, j, j'. When the damper of the pipe, h, is closed and the damper, j', opened, the blast will be delivered upon the grate and a reducing flame produced which will pass through the flue, g, into the chamber, F; and when the damper, j, is opened, oxygen will be supplied to the revolving cylinder, K, which contains the ore, through the chamber, F, and an oxydizing heat produced. In communication with the chamber, F, opposite the blast pipe, h, is the revolving cylinder, K, into which the ore is fed through the hopper, L, so that as the ore meets the blast and heat from

the chamber, F, it will be carried into the revolving cylinder and there subjected to heat and roasted while passing through. In connection with the furnace, A, and revolving cylinder, K, is the dust chamber, B. The heavy ore passes from the cylinder, K, into this chamber and is taken away from the doors below. The light dust is carried by the current of air against the revolving perforated discs in O, one half of which are submerged in water. These discs permit the passage of air, but the wet surfaces catch the dust, which, by the revolution, is carried under the water and washed off into the vat below where it can be taken out when required.

The process of feeding the wood into the closed chamber where it may be subjected to heat without air is an important improvement, and as can be seen it will descend to the fire as it is needed. The cyl-

AMBLER'S BLOWPIPE FURNACE.

inder is worked by friction gearing. This invention was patented through the SCIENTIFIC PRESS Agency, by the above named gentleman, who can be addressed, for further information concerning it, at our offices.

**IMPORTANT MINING SUIT DECIDED.**—The great mining suit of the Eureka Mining Company against Aspinwall, of New York, and others, was decided on the 19th inst., at Provo, by a jury, for the plaintiff. The contest was for the title to the King David mine. The next trial, which commences immediately, is for the Mai Henrietta. Both mines are immensely valuable, and the suits in regard to them are the most important that ever occurred in Utah.

**ENGLISH PATENTS.**—According to the British Commissioners of Patents Journal, eight British patents were granted to residents of San Francisco in the year 1867; twelve in 1868; and thirteen in 1869—making a total for the three years of thirty-three. Average number, therefore, per year, eleven.

## Academy of Sciences.

The Academy met last Monday evening, President Blake in the chair. J. A. Whiting was elected a member. Dr. George Hewston was elected Secretary, to fill the place of B. J. Avary—resigned. Several contributions to the library were received.

A letter was received from Mr. Romero, of Mexico, containing a specimen of fibre very similar in appearance to the ramie. This fibre is stronger than cotton, and used to a great extent in Mexico. It grows in great quantities on the coast. It is an annual, and Mr. Morrell thought it might be grown with success in Lower California. He had experimented with it in latitude 18° 30', and also with the ramie, and thought it could be cultivated with as much success as the ramie.

Hot Spring Deposits in Humboldt, Nevada.

and yet this process can only have been going on during the present geological epoch, or since the surface of this portion of the globe has been subject to any disturbance.

The earth is made up of fine particles of clay and sand, with, he thought, fully a third of diatoms. It also contains many silicious concretions and as he was convinced from the formation of the ground that these would not have been carried there by water, he concluded that they must be silicified organic remains. On making a thin section of one of these concretions, the microscopes showed that this was the case, a pair of legs of some coleopterous insect being plainly visible in the quartz. The greater part of the concretion seemed made up of petrified algae. It is impossible to say without further exploration, how far this deposit of diatoms extends.

## Remarkable Plant.

Mr. W. G. W. Hartford submitted a remarkable plant from San Miguel Island, which is about 30 miles off the coast from Santa Barbara. It is known to science as *Leptosyne Maritima*. It also abounds on Santa Catalina Island off the coast of San Pedro. The peculiarity of this particular specimen consisted in its enlarged size and general robust appearance, when contrasted with that of the same species grown on the main land in Santa Barbara county, near the coast, where it is a fine golden flower two or three inches in diameter with a stem about the size of a quill. The one exhibited differs greatly in size, so much so, that aside from close botanical alliance no one would casually suspect any kindred or special family resemblances. Dr. Kellogg said that this plant exhibited a marked and peculiar example of the fact that plants would harmonize themselves with the surrounding conditions of nature, and, so to speak, acclimatize themselves. This section of the body of this one was from three to five inches in diameter, with concentric rings of annual growth, with an inch in diameter, and limbs like a broom handle. On the coast it is a sub-perennial herb. No plant possessing so much interest to the floriculturist has ever been brought before the Academy.

Dr. Hewston asked if Dr. Kellogg thought this plant gained additional strength by reason of its growing in an exposed position where it was subjected to heavy winds. He called attention to the fact that, as a rule, the heaviest bodied vegetation grows on the sheltered sides of hills.

Dr. Kellogg thought that observation did not apply to all vegetation, but that this species and several others which he named were not affected unfavorably by hard winds. He thought that, as a rule, the vegetable as well as the animal kingdom adapted itself to climatic and other circumstances.

**RAILWAY CONSOLIDATION IN ENGLAND.**—The English are not much behind our people in railway consolidations. A consolidation has just been effected of 2,000 miles of road and \$400,000,000 of capital. The company expects to do one-fifth of the entire railway business of the kingdom.

**PROFESSOR TENNY,** of Dartmouth College, has recently discovered seventy new bright lines in the spectrum of the sun's chromosphere.

THE footprints of inventors are the foot-holds of progress.

# MECHANICAL PROGRESS.

## A New Kind of Wall.

A new kind of wall is coming into use in England, the advantages claimed for which are the very important ones of non-absorbency of moisture, non-conduction of heat, economy of space, a washable surface, and withal cheapness. Over a framework of strong cross wires, of about one-eighth of an inch thick, there is woven, by a powerful pressure, fibrous matter, which is saturated with a solution that renders it fireproof. It is then subjected to a very powerful pressure. A coating of light Scott's cement is then put upon it for inside facing, and of Portland cement for outside facing. By this means surfaces are made impermeable to moisture, smooth, and easily washed with water; thus saving the expense of repeated lime-washings. It is formed into slabs in iron frames, which are put together and closely and securely fastened with bolts. The slabs are from one and a half to four inches thick. They are found to serve as superior panelling for dividing walls and partitions. Where space is of importance, it has the advantage, perhaps, over concrete walling, in enabling a wall to be made of not more than one and a half or two inches in thickness, and yet its quality is said to greatly deaden sound.

**ITALIAN SUBMARINE EXPERIMENTS.**—An Italian named Foseli, has lately been experimenting, and successfully, with a new submarine vessel of his invention, in the presence of leading men of the Italian naval, scientific, and civil services. The invention consists of a construction of wrought-iron plates divided into three compartments, of which the lowest contains 1,000 pounds of ballast; the second or middle chamber is prepared to accommodate two persons; the third or uppermost chamber is filled with compressed air. This compressed air, by means of ingenious machinery, is capable of supplying means sufficient to sustain the life of two persons 50 hours.

At one of the late experiments, this vessel descended to a distance of 33 fathoms below the surface of the water, and remained submerged for 22½ minutes, without the slightest discomfort being experienced by the navigators. The specific gravity of the ballast serves to retain the vessel in an upright position, and peculiarly simple machinery enables it to move in any direction. An attached illuminating arrangement renders objects within a large area perfectly visible. The intention of the inventor is to have four machines of different capacities; one for coral fishing, another for sponge and pearl fishing (requiring a deeper descent), another for exploring unken vessels, and lastly, one for scientific investigation and warlike purposes. —*Artisan.*

The fact that life can be sustained below water for an entire day, or even longer, by means of an occasional spray of water within the vessel or diving-bell, as indicated in the Ryesson patent, has been fully established years ago, by experiments in New York harbor. This mode is much simpler and less costly than by the compressed air arrangement, as above described.

**RUSSIAN SHEET IRON** has been recently subjected to chemical examination in the metallurgical laboratory of the Royal School of Mines, and the analytical work has been executed by Dr. Percy's assistant, Mr. W. J. Ward. The occurrence of a peculiar carbonaceous mass, left after the solvent action of dilute hydrochloric or sulphuric acid, may reasonably be accounted for, Dr. Percy says, by the method of manufacturing Russian sheet iron, which he describes. The sheets are interstratified with charcoal powder, and bound up in packets, each of which is subjected to repeated hammering. Hence, it is easy to conceive how fine particles of charcoal should be beaten in over both surfaces of each sheet; and, if this be so, a relatively larger proportion of carbon should exist in the thin sheet, as is the case. Yet, that some of the carbon is combined, may be inferred from the fact that distinct hardening occurs after heating the metal to redness, and immersing it while hot in water, and especially in mercury.

**A NEW ICE MACHINE.**—It is said that a Prussian engineer has invented a machine which will produce ice without chemicals, merely by the compression and expulsion of air. A machine makes two tons of ice per day, and the capacity can be increased to 20 tons.

**IMPROVED PROCESS FOR MAKING TUBES.**—In making iron tubes, Mr. H. Kesterton, Birmingham, reduces pig-iron to the state of soft malleable iron by the Bessemer or other similar process, and casts it into a hollow cylindrical ingot. He takes this ingot while still very highly heated, and passes it through a series of pairs of grooved rollers set in different planes—say, alternately vertical and horizontal. The first pair of rolls takes the ingot, and reducing and elongating it, passes it to the second pair immediately beyond, and this pair passes it to a third pair, and so on, until the desired reduction is obtained. Each successive pair of rolls is driven at a surface speed greater than that of the rolls immediately in front, so that, allowing for the elongation of the tube, and the reduction of the section, equal quantities of metal may pass between all the pairs of rolls, gripping the ingot in equal times. A stationary mandrel passes between all the rolls, and carries a bulb at the nip of each pair of rolls.

**A NEW IRON PROCESS.**—The *Iron Age* notes a new iron process, now being practically tried—in the neighborhood of Pittsburgh, we presume. The ideas of the inventor, who have patented their process, are that iron ore can be reduced without the admixture of coal or the use of a blast, all the metallurgists to the contrary notwithstanding. The peculiar process consists in conducting a volume of steam, at the same pressure as that of the ordinary blast, into and over a coke fire, there decomposing the steam and reducing the ore by the additional heat, while sulphur and phosphorus are eliminated by the hydrogen, in the form of sulphuretted and phosphoretted hydrogen. No specimens of product yet on hand; when there are, they will be on exhibition in New York. Whether successful or not, says the *Age*, a trial furnace of a working size is being built, and the matter will soon be an accomplished fact or another fizzle.

**STEEL HORSESHOE NAILS** are proposed by a Canadian inventor—the metal being formed for this purpose into bars by rolls, which reduce the steel to any desired thickness; and as steel is homogeneous, the plates can be cut in any and every direction. This being the case, instead of cutting sections, as when iron is used, the inventor makes strips of indefinite lengths from the steel, with the heads on both sides of the strips, and which are therefore entirely unlike the corrugated iron heretofore rolled for the ordinary horseshoe nails. This is considered quite an improvement; but though a variety of devices have from time to time been brought forward for producing a nail more perfectly adapted to ensure strength and durability to the shoe than has hitherto been the case by the old hand methods, it does not appear that the pointing of the nails in a superior manner, is, as yet, satisfactorily accomplished by machinery.

**A REMARKABLE SAW.**—The *Iron Age* speaks of what is called the "Lightning Saw," as follows: "A chestnut log, nine inches in diameter, was sawed off with his cross-cut saw, by two men, in three and three-quarter seconds, by three and a half strokes of the saw. It was then sawed across sixteen times in two minutes and sixteen seconds, or faster than a cord in nine minutes, including lost time. This saw differs from all the well known clearing teeth saws in use. Its teeth are all beveled blades for cutting, while clearing teeth are dust removers merely, requiring to be shortened, and are left full thickness of saw plate, as they do no cutting. The Lightning Saw is designed to cut timber by direct action both ways. This is accomplished by the form, spacing, dress and setting to cut in line of the two points of each M as one tooth. If one point of M tooth was set one way and one the other, the slant would ride and lift out the tooth.

**EFFECT OF COLD ON IRON AND STEEL.**—For many years, until quite recently, it has been almost an axiom among civil engineers that great cold tended to produce a brittle condition of iron and steel, and that by this hypothesis might be explained the alleged increase in the breakage of trees, axles and rails in railroad traffic.

According to the recent experiments of Joule and others, however, it would seem that iron and steel instead of being weakened by freezing weather, are actually capable of resisting greater shocks than when retained at a summer temperature. While not denying the fact of the greater frequency of such railway accidents in winter, Dr. Joule refers them to the increased hardness of the ground by freezing, by which the iron is subjected to a greater strain or shock than in summer.

# SCIENTIFIC PROGRESS.

## The Cause of Volcanoes.

The opinion of the old Werneriens, that volcanoes are due to chemical action, and not to supposed central fires, appears to be gaining ground. The question whether we are living on the cooled surface of a globe of molten liquid matter, with a thin shell of only 50 or 80 miles in thickness, or whether the earth is firm and solid to the depth of 1,000 miles or more to its very centre, is of no little interest to many timid minds, on the score of personal safety; but the chief importance to the scientist is the relation which the question bears to the character of volcanoes—whether they are fed from internal fires, or whether their most remarkable phenomena are the local and comparatively insignificant results of chemical action.

During the latter portion of the late Imperial rule in France, the former theory was quite in the ascendant in that country, kept so through the teachings and writings of M. Elie de Beaumont, who, by Imperial favor, was continued as the chief director of the French official geologists; although his opinions were not in unison with most of the distinguished French scientists. The fall of the Empire led to a change in this direction, and to a decided reaction in favor of the chemical theory of volcanic disturbances; which opinion has long been quite general among German and English geologists.

M. Fouque publishes an article in the April number of *Revue des Deux Mondes*, in which he takes strong ground in favor of the chemical theory, and endeavors to show that there is a complete series of gradations between the simple phenomena of the emission of inflammable gas, and the thermal *fumerole*, that nearly approaches to the true volcano—that the mere emission of gas may pass into the mud volcano, and the latter into the thermal *fumerole*; while the characteristics of the lost alternate with those of full volcanic action, in nearly every known volcano.

The usual products of volcanoes are just what would be expected were chemical action their cause. Indeed the peculiar action of the products, according to M. Fouque, is hard to explain on the theory of an igneous nucleus.

If the crust of the earth is but 50 miles in thickness, however hard it may be, it would, considering the immense diameter of the earth, be almost as elastic as a soap-bubble, while the interior fluid mass would be subject to tides like the ocean. The result would be that we should have regular earthquakes twice a day, all over the earth. This not being our experience, the theory of the 50-mile crust must, say the Werneriens, be given up as untenable, and we are compelled to fall back on the chemical theory for an explanation of the origin of volcanoes and earthquakes. Although most astronomical and physical reasoning has been introduced in efforts to solve the great question connected with volcanic phenomena, still, it must be admitted that the evidence thus far adduced is quite insufficient for fully sustaining either assumption. Daring generalizations are as unphilosophical in physics as in politics; hence the folly of dogmatism, regarding the origin of volcanoes or the theory of internal heat.

**PURIFICATION OF FATS.**—The *Comptes Rendus* gives an account of a process communicated to the French Academy by M. Boillet. Suet, or fat of any kind, is heated for three or four hours with lime water, the proportions being about half a gallon of lime water to 2½ lbs. of fat; it is then allowed to cool. As soon as the fat is sufficiently set, it is transferred to a linen or flannel bag, and the water and oleic acid squeezed from it by gradually increasing pressure, in a hydraulic press, or otherwise. He states that fatty matters thus treated lose all bad smell, and acquire remarkable whiteness and hardness, after standing a few days. If re-melted in water, acidulated with sulphuric acid, acetic acid, or vinegar, a fat is obtained which is "perfectly" purified, and can be applied to all purposes for which the best fats are employed.

**TEST FOR BENZOLE.**—For distinguishing genuine benzole, or that made of coal-tar, from that prepared from petroleum, Brandberg recommends us to place a small piece of pitch in a testing tube, and pour over it some of the substances to be examined. The genuine will immediately dissolve the pitch to a tar-like mass, while that derived from petroleum will scarcely be colored.

## The "Psychic Force."

Dr. Crooks, in the last number of the London *Quarterly Journal of Science*, gives an elaborate article to sustain his alleged discovery of what he calls "psychic force," and details some further experiments, in addition to those given in a previous number of that journal, some account of which we reproduced in the Press in our issue of August 26th, 1871.

He braves the storm of ridicule which he has invoked, with a boldness and spirit of candor which shows that he is an earnest man, and one determined to persevere in his line of investigation without fear or favor. His position as a scientist, is acknowledged intellectual attainments and power, and the spirit of candor which he manifests under peculiarly trying circumstances, cannot fail to command the respect of all who are following him in his investigations, whether in a spirit of sympathy or with the view of criticism.

His latest experiments were conducted with more caution than those first published, while their apparent results are even more remarkable. In his last communication he remarks that so far as his other occupations will permit, he proposes to continue his experiments in various forms, and report from time to time their results. In the meanwhile he hopes that there will be induced to pursue similar investigations in a scientific manner.

The Doctor applies some caustic remarks to the tender skin of Prof. Stokes, who presumes upon a severe criticism of the experiments, while he refuses to witness them in person, when he has ample opportunity and is urged to do so.

We shall watch with interest the progress of these experiments and the discussions which grow out of them, and report, thereupon, whenever anything definite or of special importance shall have been eliminated.

## Mechanical Effect of Magnetization.

The following is from a lecture by Prof. Tyndall:—"The effect I wish to make manifest was discovered by Mr. Joule, and was subsequently examined by MM. Dela Rive, Wertheim, Marian, Matteucci, and Wartmann. It is this:—At the moment when the current passes through the coil surrounding the electro-magnet, a click is heard emanating from the body of the iron, and at the moment the current ceases a click is also heard. In fact, the acts of magnetization and demagnetization so stir the particles of the magnetized body that they, in their turn, can stir the air and send sonorous impulses to our auditory nerves. The sounds occur at the moment of magnetization, and at the moment when magnetization ceases; hence, if a means be devised of making and breaking, in quick succession, the circuit through which the current flows, we shall obtain an equally quick succession of sounds. I do this by means of a contact-breaker which belongs to a Ruhmkorff's induction coil. A thin bar of iron stretches from one of the bridges of this monochord to the other. This bar is placed in a glass tube, which is surrounded by copper wire. The contact-breaker is placed in a distant room, so that you cannot hear its noise. The current is now active, and every individual in this large assembly hears something between a dry crackle and a musical sound issuing from the bar in consequence of its successive magnetization and demagnetization."

**AN EIGHTH RIB IN MAN.**—Mr. Perrin makes a communication to *Nature* in regard to the occasional occurrence of an eighth true rib in man; although it has been generally considered that even form the absolute limit. This eighth rib is sometimes found on one side only, still more rarely on both sides, and it is suggested by Mr. Perrin that cases of this abnormal character possibly occur more frequently than has been suspected. The maximum normal number of sternal ribs appears to be ten, but in the higher primates the tenth, ninth, and eighth are successively lost in the transition from their lower to the higher forms. In the carnivora the sternal ribs are usually nine, although the Esquimaux dog, the Arctic wolf, and the *proteles* have only eight. The common badger of Europe has ten true ribs.

**STILL ANOTHER.**—In our notice of the recently discovered asteroids in last week's Press, we inadvertently omitted the most recently discovered one—the 117th, which was made on the 14th of Sept. by Dr. Luther Bilk. It was equal in brilliancy to a star of the 11th magnitude.

## THE WATER QUESTION.

By A. B. BOWEN, CIVIL ENGINEER.

(Concluded.)

## The Common Practice

is, to remove the sod from the base of the levee and surface of the ditch, to the depth of about six inches, and lay it away for the facing of the sides; and when these are well beaten into place with the back of the shovel, the levee becomes so matted with roots and covered with grass as to withstand a considerable action of the waves which usually effect it only for a few hours at any one time. But this facing of the sides is expensive, and much less valuable here than where there are frequent summer showers; for such is the aridity of our climate, that these sods seldom take root, and on the tule lands, where this practice is not much in vogue, frequently dry up and float away; though very low levees, constantly washed by the tides, retain sufficient moisture to become sodded over.

The ditch should be on the inside, so as to serve for drainage, and not be exposed to the action of waves. If only for the discharge of waters of filtration, and the rainfall on the marsh itself, the floodgates may be few and small.

The salt marsh along the southern portions of the Bay of San Francisco, being less exposed to the action of storm waves, will need less protection, and other things being equal, can be reclaimed at less expense.

## Swamp Land Irrigation.

Let it be borne in mind, however, that the soil of all reclaimed swamp land, whether salt or fresh, is so poorly adapted to the retention of moisture as often to suffer from drouth even in lands of frequent summer rainfall, and is almost valueless in dry climates, without irrigation. Paradoxical as it may seem it not unfrequently requires under drainage also, as is well known to all engineers of experience in this kind of work. Salt marsh, however, is sometimes so constantly wrapped in fog, as to derive much moisture from that, though as a general rule, the fog does not lay low enough to be of much service. We have no reliable information on this point, concerning the marsh of which we have been speaking, but the fogbanks of Tomales Bay hang at an elevation of from fifty to several hundred feet above the water; and the grain on the hill-sides, bathed in fog, make ranker growth, and are two weeks later in ripening than that on the narrow strip below the fog along the shore.

## Conclusion.

Tonching here and there, with utmost heaviness, upon a few only of what may perhaps be termed the more important points on the agricultural side of the question, yet, have we largely exceeded the time and space designed for this article, and must hasten to close, leaving many other points equally important, wholly without notice.

Our leading ideas upon the agricultural hearings of the subject may be summed up, in brief, as follows:

1. Canals of irrigation for both swamp land and upland, constructed only after careful surveys shall have shown their most advantageous location.

And that these italics may not be regarded as a deliberate insult to the intelligence of our readers, we hasten to assure them, that large sums of money, have everywhere been misapplied, and the interests of large localities, sacrificed, by the improper location and construction of works of irrigation, from insufficient surveys; and that, not only in Spain, and Italy, but also in India, where irrigation is most extensively and skillfully practiced, large outlays have been necessary to correct these errors. A notable instance of which is that of the Ganges Irrigation Canal, than which, perhaps no more expensive example of amateur engineering can anywhere be found.

2. Reservoirs through the foothills and mountains, principally as supplemental feeders during low water, to the canals of irrigation and for the irrigation of lands above the reach of the canals; but secondly, for diminishing to some extent, the rise of rivers, and the consequent cost of levees.

3. Catchment drains, to protect basins from the drainage of the uplands; so located and constructed, as to serve for irrigation also.

4. Levees and dams, to exclude the water of rivers and sloughs.

5. The present method wherever practicable, of tidal, fresh water irrigation, through flood-gates properly constructed for this purpose.

6. Thick rows of trees, to shade all the lines of distribution, diminish evaporation, and serve as a partial protection from the scorching winds of summer.

7. Steam pumps, if necessary, to remove surplus water collecting in large basins, from rainfall within their borders, or from springs or filtration.

Though the experience of years, has thoroughly demonstrated that the porous soils of our reclaimed swamp lands, from mountain valleys five thousand feet in elevation, all the way to the sea, everywhere require irrigation, much more than our upland, yet we not unfrequently bear upon the necessity of irrigation on uplands, who scout the idea of our swamp lands suffering from drouth; and this, too, when every time these men, pass up or down the Sacramento, or San Joaquin rivers, they look out upon lands formerly three feet under water, that to their certain knowledge, are now constantly irrigated by the tide. We read of men of old time, that, "having eyes, they see not;" while a later proverb assures us that "none are so blind as they who will not see." It is evident that human nature is still the same.

We assure those interested in this subject, that irrigation, when properly applied, whether upon swamp land, or uplands, has invariably been attended with most satisfactory results. A water rent the past season of \$4 per foot for twenty-four hours, or about \$4 per acre, has enabled farmers in Yolo, to obtain a remunerative crop, from this partial irrigation, where nothing could have been made without it; while two heavy crops have been obtained in Fresno, from a single flooding of the land, previous to putting in the first crop; though the crops upon the adjacent unirrigated land, was a total failure.

Three crops of hay in a single season have been raised in the mountains, yielding eight tons per acre, from an irrigation during the dry season, of about 2,000 cubic feet of water per week; and within the last nine months, sixty bushels of barley, and three crops of alfalfa, yielding one and a half tone per acre per acre, have been grown upon thoroughly irrigated swamp land, and probably two more crops of hay can be harvested within the year—making six crops in all from the same piece of ground.

Both horses and steam have been profitably employed this season in the irrigation of swamp lands above the reach of the tide. One gentleman whom we found pumping water with six horses, for the irrigation of his swamp land, assured us that the value to him, of the water so applied could not fall short of \$100 per day.

As fast as possible we should utilize the drainage, which would at the same time, limit the sudden flooding of our rivers and valleys, and prevent the drainage of the foothills and mountains from sweeping our levees into the river, as has sometimes been the case, heretofore. We need the entire rainfall of the State, for irrigation, and should save all we can.

Build reservoirs, sluiceways, and canals. We need them everywhere; high up the mountain sides,—down in the foothills,—in each little valley. Dam each little creek and cañon. Collect water everywhere, and spread it all over the country. Then will our lands be full of fatness, and our granaries filled to overflowing. Then will our rivers be kept within their channels by moderate embankments, and the irrigation of upland and lowland, the reclamation of swamp land and tide land, and the enrichment of our people go hand in hand.

LAND NOTICE.—Notice has been given that the following township plats were received and filed in the United States Land Office at Sacramento, California, on the 11th inst., viz: Township 7 north, range 7 east; township 14 north, range 11 east; township 14 north, range 10 east. Persons claiming the right of pre-emption in the above-named townships should attend to filing their claims within the three months prescribed by law, otherwise their right of pre-emption will be forfeited upon the odd numbered sections. Within these townships are situated the towns of Forest Hill, Yankee Jim's, Wisconsin Hill, Elizabethtown, Deadwood, and Michigan Bluffs.

REQUEST TO THE DEAF AND DUMB ASYLUM.—R. W. Durham, of Chico, recently deceased, left property to the State Deaf and Dumb Asylum valued at about \$100,000.

## Railroad Items.

The Virginia and Truckee railroad was formally opened, on the 7th inst., from Reno to Steamboat Springs, a distance of twelve miles.

A project is on foot for the construction of a narrow-gauge railroad through Napa Valley, the termini to be Calistoga and a point on Napa Creek, near Suscol. The cost of the road is estimated at \$200,000.

The construction of a narrow-gauge railroad from Petaluma to Sanaclete is being agitated in Sonoma county.

The through passenger trains of the Pacific railroad now run by the Vallejo route. It is said that a double track will be laid from Vallejo to Sacramento within a year.

Turton & Knox have contracted for the grading of the railroad between Healdsburg and Cloverdale, seventeen and a half miles long; and also from Petaluma to Bloomfield. Sonoma county gives a subsidy of \$5,000 per mile, and both must be completed by the 19th of next March.

The directors of the Antioch and Visalia railroad have given instructions to complete the purchase of the right of way, and award contracts for grading and bridging. Sealed proposals for the construction of a wharf at Antioch and trestle work, extending from the wharf to Smith's Point, are advertised.

The agents of the Central Pacific Company have negotiated for and secured the right of way from many land proprietors for a line of road between Oakland and Santa's.

A heavy force of workmen are employed in building the railroad between Gilroy and Salinas City.

The people of Santa Clara county voted on Wednesday of last week on a proposal to accept from the Central Pacific Railroad Company \$100,000 for its railroad stock.

The right of way through and privilege of grading Fourth street, Portland, has been granted to the Oregon Central Railroad, provided that the expense of grading the road is paid by the company.

The supervisors of Santa Cruz have passed an order, to submit to popular vote the question of giving a subsidy of \$100,000, for the construction of a railroad from Watsonville to the county seat.

The San Joaquin Valley Railroad is advancing southward, at the rate of half a mile daily, and will soon reach Bear Creek.

Engineers are engaged in surveying a railroad route, from Summit, Solano county, via Oak Grove, to a point on the projected Sonoma railroad.

The California and Oregon Railroad will reach Red Bluff, this week.

A railroad enterprise is talked of in Eastern Nevada, to open up the resources of the country.

The Walla Walla and Columbia River Railroad Company propose to build a narrow-gauge railroad, from Walla Walla to Wellhula, provided \$75,000 is raised.

Leevenworth has appropriated \$250,000 toward the construction of a narrow gauge railroad, from that city to Denver. The people of Colorado propose to raise \$500,000 for the same object.

The Texas Pacific Company is combining the various railroad interests, for a through line from the Mississippi to San Diego.

The first division of the Denver and Rio Grande Railroad is completed and in full operation. The width of the track is 3 feet, and that of the cars 6½ feet. It is intended to extend the road to Santa Fé.

T. G. Eastwick and party, who have been surveying a passage through the Bitter Root range, for the Northern Pacific Railroad, have returned to Lewiston, being prevented from further explorations by snow. The Northern Pacific expect to have nearly one-third the distance across the continent completed by the close of next year.

Trains on the California and Oregon Railroad will be running through, from Eugene City to Oakland, Oregon, by the middle of December.

A project to connect Santa Cruz with the Southern Pacific Railroad is being agitated.

The Utah Northern Railroad, narrow gauge, is being pushed ahead. This road will take the Idaho and Montana trade from Corinne. Work on the Utah Southern Railroad is being vigorously prosecuted. It is in operation for 17 miles, and will be finished to Lehigh, 30 miles, before the close of the year. This road is the exclusive work of the Mormons.

A surveying party are locating the line of the O. & C. Railroad, on the east side of Wapato Lake, Oregon, and will cross the Yamhill river, between Lafayette and Dayton.

It is reported that the terminus of the Northern Pacific Railroad on Puget Sound, will be located within sixty days.

Ten per cent. has been paid in on \$130,000 of the \$150,000 subscribed for the recently organized San Diego and San Bernardino narrow-gauge railroad. Application has been made to the Board of Supervisors asking aid to the amount of \$100,000 in twenty-year bonds. The projected road will be 124 miles in length and will cost a million and a half fully equipped.

A large and elegant railroad depot is to be built at Vallejo. It will be semi-gothic in style, and will contain, besides the sitting room and baggage room, a ticket and telegraph office. The platform will be 30 feet wide.

During the past week a surveying party have been surveying a route proposed for a railroad from Sancelito, to connect with the California Pacific railroad, on the Summit in Jamison Cañon, about 48 miles from Sacramento.

The *Celusa Sun* discusses the feasibility of a narrow-gauge railroad from Colusa to Marysville. It says it is claimed that it can be built and stocked for about \$8,000 per mile, and the entire cost of the proposed road would only be \$200,000.

## Inyo County—The Silver Sprout.

The *Inyo Independent*, in a late issue, gives some interesting particulars about the series of mines in that county, known collectively as the Silver Sprout, and from which we condense the following:

The series comprise some thirty different ledges, together forming a complete labyrinth or network of quartz veins, such as is seldom met with—perhaps nowhere else in the State. Some 20 shafts and tunnels have been opened on this property, within an area of 500 by 2,000 feet, and from the developments already made, the evidence is very conclusive that the property must be a very valuable and extensive one. Within the area above mentioned there are not less than 30 different ledges, together forming a most perfect labyrinth or net work of quartz veins. The two principal ones, called the "Lomb" and "Silver Sprout" are about 300 feet apart, parallel to each other, and to the crest of the mountain. They cut through and across three ridges, which extend down the side of the mountain. This gives the best possible position for prospecting at varying heights. Both of these ledges have been opened at various places, from 50 to 300 feet apart, covering in all some 1,500 feet. Several of the minor ledges have been prospected, each presenting the same general characteristics of the main, or Silver Sprout.

In order to determine the future course in regard to the management of the mine, Mr. Wingard has selected for shipment and reduction in San Francisco, about 3,000 pounds of fair, average ore, a portion from the several different openings of the mine. The location considered in relation to the facilities for getting out and reducing the ore may be considered as good as could be desired. The altitude is very great, probably not less than 10,000 feet above the sea. It is about three miles distant from, but fully 3,000 feet higher, than the famous Kearsarge mine, and on the same mountain. It is, however, an entirely distinct series of mines, though there is a great similarity in the nature and appearance of the ores of the two mines. Both carry a small percentage of base metals, but scarcely enough to be considered "rebellions." The mine is situated upon the southern face of the mountain in such a manner that the snows or storms cannot materially effect the transportation of the ore by tramway, which is the only cheap method practicable.

The mill now owned by the company is down the cañon nearly 5 miles. The proper place for the mill and to which it will soon be removed is immediately below the mine and about one mile distant. Here there is an abundance of timber and water, a wide valley free from all dangers of snow-slides, and where, by means of a tramway, ore can at all seasons of the year be shipped directly from the mine to the batteries. The whole cost of mining, transportation, and reduction of the ore from the mine, with the proper and practicable facilities, need not exceed \$10 per ton. The Silver Sprout is unquestionably a very valuable mine, and with proper management cannot fail to remunerate its owners and at the same time prove of great benefit to this section generally.

# MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**EXCHEQUER MILL.**—Alpine Miner, Nov. 11th: This mill was crippled in its operations on Tuesday by the carelessness of a workman in not oiling the cams and attending to the revolutions of the stamps properly. One entire battery was nearly ruined.

**FLATTERING** indications are found at several new points in the Silver Glance, which adjoins the Tarshish on the same lode. Ore of fair quality is found in the Monitor No. 3, on the same lode.

The Mills of the Monitor and Tarshish Cos. are progressing at a favorable rate and the Hoisting works of the Globe will soon be complete.

### AMADOR COUNTY.

**LITTLE AMADOR.**—Amador Ledger, Nov. 18th: The new mill intended for crushing the quartz taken from the Little Amador mine, at Amador City, is fast reaching completion, and will be ready for operation by the time the winter rains fairly set in.

**KENNEDY MINE.**—After a "run" of 16 days, the batteries in the mill were cleaned up on Monday last, and the yield realized \$6,000.

**KEYSTONE MILL.**—The new quartz mill now being erected by the Keystone M. Co., at Amador City, is nearly completed and will soon be pounding away.

### CALAVERAS COUNTY.

**"STRUCK IT."**—Calaveras Chronicle, Nov. 18th: Asbury & Co., props. of the Good Hope mine at Mosquito Gulch, have struck pay ore. For 7 or 8 months they have been steadily at work running a tunnel to intersect the lead, and after digging 500 ft. through solid rock they have accomplished their purpose. At the point of intersection with the tunnel the ledge shows 18 inches in width and the quartz prospects \$10 per ton. A level is being run in the direction of the old shaft sunk on the lead, with the expectation of finding better rock.

**RICH ROCK.**—Very rich quartz has been struck in the Wolverine mine near Railroad Flat.

**BATES & Co.**, props. of the old Mok Hill tunnel mine, near town, are taking out good pay.

**WEST POINT.**—Six tons of quartz from Hadler & Steger's late strike paid \$52 per ton. They will put up the necessary machinery at once, to work the lead, with an overshot waterwheel as motive power. Harris and Bailey have recommenced work, sinking on the "Woodhouse" mine. Reed & Hillary's last crushing of assorted rock paid \$100 per ton. Morse & Doyle are getting very good rock.

### INYO COUNTY.

**STUCK IT.**—Inyo Independent, Nov. 11th: The San Lucas mine, at Cerro Gordo, presents a magnificent appearance, showing a very rich ledge 8 ft. in width. One-half of this is classed as smelting ore, while the other side is found to be milling rock. The Cervantes mill, at Lone Pine, is to be started up and run on the latter quality of ore.

**STRIKE.**—The strike of an extensive body of lead ore in the Omega tunnel, at Cerro Gordo, is reported. It is in a cross vein, 900 ft. from the mouth of the tunnel. Drifts to the northwest disclose the solid metal 4 ft. in width.

### MONTEREY COUNTY.

**QUICKSILVER MINE.**—Grass Valley Republican, Nov. 15th: A rich quicksilver mine has just been discovered at San Juan South. The vein is 6 ft. wide, exposing one of the finest bodies of ore ever seen, with a foot of vermilion earth covering the ledge in its entire length. Parties are negotiating for the mine for \$200,000.

### NEVADA COUNTY.

**COE MINE.**—Grass Valley Union, Nov. 18th: Fine specimen rock, showing gold and rich in sulphurets, has of late been coming out of the shaft. The ledge is 4 ft. thick and the rock is ribbon rock. The shaft runs through 60 ft. of this fine ribbon rock, and is down 280 ft.

**BEN FRANKLIN MINE.**—A clean up of the old Ben Franklin mine was made yesterday. The rock crushed was 27 loads, and the yield was \$1,230, or within a fraction of \$45 to the load.

**SAPPHO LEDGE.**—The Sappho location is on a ledge in Toothaker's ranch, north of the Allison Ranch ledge and on a line with the Allison. Some work has lately

been done, with good results. Rock has been taken out which gives splendid prospects in a hand mortar.

**DARTMOUTH MINE.**—The Dartmouth Co. has been running a tunnel into Alta Hill, from Grass Valley Slide. A few days ago the tunnel was raised up and the miners struck into a body of gravel, which is said to prospect well.

**NORTH STAR MINING MACHINERY.**—The North Star mine is to have a new boiler and a new engine for running the mill.

**HOPE GRAVEL MINE.**—The clean up last week was a very good one. After a run of 10 days, 182 ozs. of gold was taken from the mill. This is worth about \$3,100. The gravel in the drift is looking well, and the next run will probably be as good as the last one was. Preparations are now being made to run a drift in a southerly direction, towards Adams' ranch, with a view to striking a large body of gravel known to be in that part of the hill.

**DAISY HILL MINE.**—The Daisy Hill mine is a little to the east of south from Ophir Hill. There is a shaft down 150 ft. on the incline and from the bottom of the shaft a drift is run 100 ft. towards the south. The ledge pitches to the west at an angle of about 45 degrees. At the mine there are 2 steam engines, which do the hoisting and pumping. Each have an 8 inch cylinder. Yesterday the proceeds of 42 loads of rock were brought into Grass Valley and the gold was valued at \$6,500.

**MINING LOCATION.**—National Gazette, Nov. 13th: J. W. Rely and others have located, 1,300 ft. of the Western extension of the Knights of Malta quartz ledge on Roberts ravine, Grass Valley township.

**COLUMBIA HILL.**—Nevada Transcript, Nov. 19th: The miners at Columbia Hill are preparing for winter work. The Union G. M. Co. and Nichols & Co. are building a large reservoir near Lake City, and fitting up for extensive work at Kennebeck Hill this season. It is reported that the Leke Co. will complete the flume started by them some time ago, and run it up so as to work the claims formerly worked by Weighels & Co.

**GETTING READY.**—The Blue Tent miners are getting ready for work. Recently Kelham & Co., got 300 kegs of blasting powder from below, to be used in their mine at Blue Tent. They propose to raise gravel in the locality next winter if the weather is favorable.

**MINING SEASON.**—On the Little York Ridge, the Little York G. and Water Co., since they purchased the claims, have opened them systematically, and they are now taking out large returns.

The claims in the vicinity of You Bet and Red Dog purchased last year by the English Co. are being prepared for extensive washing this season.

Jacobs & Sargent are fitting up their diggings at Quaker Hill for a heavy season's work. They will run with 5 monitors and open through both Railroad and Gas cañons.

At Omega there has been great advancement in hydraulic mining, and there will be extensive work done there this season as soon as water can be obtained. Recently the miners in the vicinity of Hunnefauth's old place have found excellent prospects, and at the Cascades and on the Yuba considerable work will be done.

Along the Ridge, at Relief Hill, Bloomfield, and other points, as far down as French Corral, the miners are at work, washing when water can be obtained, and getting ready when there is no water. At Montezuma Hill, the old Keystone ground which paid well for drifting, has come into the hands of a company which is fitting it up for hydraulic working.

At Rough and Ready, the miners are much better prepared for work than last season, and are only waiting for water to commence operations.

In this vicinity, at Onetomah Hill, Cement Hill, Blue Tent and other points, much work has been done in the way of fitting up for more extensive work this season.

**TOWN TALK MINE.**—The regular monthly clean up of the mine on Saturday was \$4,000.

**BLOOMFIELD DAM.**—The North Bloomfield G. M. Co. propose to raise their dam on Big Cañon creek, near Bowman's ranch 100 ft. higher than it now is.

**JOHN BRIGHT MINE.**—Grass Valley Republican, Nov. 16th: The lessees are now running a drift on the ledge on the lower level, taking out rock as they proceed. They are at a depth of 220 feet from the surface. The ledge is about 15 inches wide. The last crushing yielded \$70 per ton.

### SAN DIEGO COUNTY.

**BULLION.**—San Diego News, Nov. 9th: The shipment by Wells, Fargo & Co. on Monday, was \$1,900.

**IMPORTANT PROSPECTING ENTERPRISE.**—Mr. Wilson, of S. F., is about to organize a prospecting expedition, to start from the mines of the Cuyamece ridge, and follow down the mountains along what is believed to be the mineral belt to the Cajon Valley, continuing the tour thence by the mountain ridge into Lower Cal., until the San Rafael region is reached.

**ITEMS.**—At Julien City, Defrees' mill is running on Helvetic rock. Gunn, Reynolds & Co. are running on ore from the Owen's mine. The Stonewall mill is crushing ore from its own mine, running on usual time. The mills are fully employed, having just now all they can crush.

Work is being prosecuted on the following named mines in Julian Dist.: The Owens (now getting out 10 tons per day), Van Wert, California, Hayden, Lone Star, Helvetia and Big Blue.

In Banner Dist. the McMechan mill has commenced crushing on ore from the Redman mine. The mill of the Antelope Co. is also running on ore from that mine.

The following named mines are at this time being worked in this Dist.: The Chaparral, Antelope, Medden, Kentuck, Redmen, Bailey, Hubbard and Golden Chariot. The latter mine has been "bonded" to Wilson & Co., of S. F., for 60 days. The consideration is the sum of \$65,000 in gold coin.

### SAN LUIS OBISPO COUNTY.

**MINING EXCITEMENT IN CAMBRIA.**—Six months ago a man named Heskins was prospecting in the Pine Buttes, 11 miles from Cambria, for a site for a sawmill. Being an old miner, his attention was attracted to certain outcroppings on the side of a mountain, and he commenced exploring. His research was rewarded by promising traces of quicksilver and streaks of fine-looking cinnabar. With a few specimens he returned to Cambria, and made known the fact of his discovery to some of the solid men, who organized a Co. and started Hastings back to his claim with tools and supplies. Satisfied that a lead of cinnabar ran through the mountain, Mr. H. explored for it from time to time. Last week his perseverance was rewarded by a "strike," and he returned to town with quite a large number of rich specimens.

**LA LIBERTAD.**—The owners of this quicksilver mine have shipped to S. F. 1,000 lbs of cinnabar, for the purpose of testing its peculiar properties and value.

### SIERRA COUNTY.

**PORT WINE.**—Mountain Messenger, Nov. 11th: The old Monte Cristo Co. has taken out but little money this season, owing to their elope-sinking. All is right now, and they are again taking out good pay, and are pushing their main tunnel towards the summit.

The Union Co. are taking out good dirt, but owing to a scarcity of water they can't work half the time.

The Queen Co. is doing first rate, having, some time ago, bought a piece of ground of the old Gate Co. that prospects very well.

The old Eagle wash but little dirt at present, for the want of water.

The old Arie, abandoned 3 or 4 years ago, is now owned by J. Lewis and H. Dranger, who are opening it again.

### SISKIYOU COUNTY.

**BLACK BEAR.**—Grass Valley Union, Nov. 18th: The Black Bear mine has a ledge 11 ft. thick, which pays, by mill process, \$80 to the ton.

## Nevada.

### COPE DISTRICT.

**LUCIA.**—Elko Independent, Nov. 18th: Harris & Co., Andrews, Robbins & Holland, are vigorously prosecuting work on different mines, all of which look promising.

Buel & Bateman have run a level along the Tecoma mine for a distance of about 220 ft., at a depth of 100 ft. from the surface; which shows a well defined vein of high grade ore from 4 to 7 ft. in width.

**COPE.**—The Excelsior M. and M. Co. have just completed a Bailey Furnace with a roasting capacity of 20 tons per day.

The El Dorado is looking well. This mine belongs to the Excelsior Co. They have a quantity of ore on their dumps awaiting their turn at the furnace. The ores are not only rich in silver, but show \$50 per ton in gold. The Co. from this time forward, expect to make monthly shipments of bullion to the amount of \$25,000.

The Monitor has some 25 tons of ore on their dump, worth about \$500 per ton.

There are a number of other mines in the dist. all looking well and plenty of ore on their dumps.

**RAILROAD.**—The Lest Chance is the most developed of any on the eastern slope of the mountains. An incline was sunk on the lode 90 ft. The top of the vein was

composed of carbonate of lead, with some galena and a small percentage of copper. At the depth of 60 ft. the copper took the place of the lead ore on the foot well for 8 ft. in width. At this point a drift was run for the hanging wall, which was found in 13 ft. end below this the copper took the form of red oxide and native copper, affording some of the finest specimens of copper ever found. A tunnel was run, cutting the lode at the depth of 90 ft., when there was another change. The lode is found at this point to be 21 ft. wide, and with the exception of 4 ft. is all good smelting ore, composed of galena and carbonate of lead.

The Hussey tunnel, near by, is taking out some very good ore. Two tunnels are now being pushed on the Humboldt, and a contract has been made by the owner, to extend the tunnel into the Shoo Fly, the dump of which shows 30 tons of very fine ore; while preparations are being made to tap the Web Foot and Tripoli deeper than the shaft has yet penetrated. The most extraordinary development yet made, is on the Ella—a mine containing carbonates of copper. The shipments made, yielded from 23 to 28 per cent. of copper, and the ore grows better as depth is obtained. The deepest shaft is only 30 ft. from the surface, and the foot-wall, while going down at an angle of 30°, changes here to a perpendicular descent. At this depth a drift has been run across the lode, found to be 20 ft. wide, and the ore, nearly the whole distance, is secked without assorting. It will yield 30 per cent. of copper. Ores are being taken from several other points of the mine, indicating a very extensive deposit. The owners are now shipping 20 tons per week, but expect to raise it to 100 tons in the course of two weeks. The Jensen, just below the Ella, has produced considerable ore of like character, and as the owners have purchased the Ella, work on the former has been stopped. The Nip and Tuck, east of the Ella, is producing similar ore.

### ELY DISTRICT.

**BULLION.**—Ely Record, Nov. 12th: W. F. & Co. shipped, since Nov. 5th, 85 bars, valued at \$129,046.79.

**STEELEDT.**—This furnace was started up on Monday on ore from the American Flag mine, and, so far as we have learned, has proved a success.

**OUR MINES.**—The Washington & Creole shaft is down about 160 ft. and still sinking, with good indications. The Pioche Co. are still busily engaged putting up their new hoisting works, and Capt. Hell says he expects to commence work in about ten days. The Lillian Hall shaft is down about 60 ft. and still sinking with good indications. Meadow Valley Co.'s mines are looking well throughout and the Co. is shipping the usual quantity of good ore. Raymond & Ely Co.'s mines looking well, and shipping large quantities of ore to the mill.

**BULLION.**—S. L. Tribune, Nov. 16th: W. F. & Co., received yesterday from the Meadow Valley Works at Pioche, 14 bars worth in the aggregate \$16,491.68. It goes this morning to N. Y. They forwarded on the 11th, to N. Y. 22 bars from same place, worth \$23,098.36.

**ON THE WAY.**—The machinery for the new 30-stamp mill of the Raymond & Ely Co. arrived in Salt Lake about 2 weeks ago, and is now on the way to this place.

**HEAVY SHIPMENT.**—Reese River Reveille, Nov. 10th: The Raymond and Ely Co. of Pioche shipped, from Oct. 1st to 31st, bullion of the value of \$306,814.40.

### HUMBOLDT.

**BULLION.**—Unionville Silver State, Nov. 18th: Amount shipped from the Arizona mine, since our last issue, was \$6,376.

**THE NEW MILL.**—The new mill being erected at Rye Patch, by the Butte M. Co. is progressing at a rapid rate, the frame work being already up and a force of hands employed in its completion. Fifteen stamps will be put in at present, with a capacity for 5 more.

**THE DUN GLEN MILL.**—Spregue & Co.'s new mill is running on gold ore, taken from the mines in that Dist. It is a success.

**GOLDODA DIST.**—Capt. Cummins of Dun Glen, has purchased the Cumberland mine for a S. F. Co., and will commence work at once. The Cumberland ledge was one of the first locations made in that locality, and has always been considered one among the best mines in the Dist. The ore is argentiferous galena, worth on an average about \$70 per ton in silver. A portion of the ore contains sufficient lead for smelting.

### REESE RIVER.

**STOLEN.**—Reese River Reveille, Nov. 10th: Between 11 o'clock last night, and daylight this morning 3 bars of bullion each weighing 95 lbs. and worth about

\$1,100 each, were stolen from the smelting room of the Manhattan Co.'s mill in this city. No positive clue has been obtained of the perpetrators.

**SILVER WAVE.**—The Lyford shaft is cased in a substantial manner since our last visit. Fair headway is made sinking. The Chonoweth shaft is down 60 ft., with streaks of ore coming in through the limestone cap. The Supt. estimates that 115 ft. additional depth will cut through to the ore channel. No. 4 shaft is down 90 ft. Breasting out will begin within a month from this date, for shipment to mill.

**GEN. LEE.**—Drift still running east in ore, which is run out through the tunnel. **NOONDAY.**—Working 7 men in a breast of ore 40 ft. long, and ranging from 2½ to 5 ft. wide. The ore averages (by assay) \$100 to the ton.

#### WASHOE.

**FRANKLIN MILL.**—Territorial Enterprise, Nov. 16th: This mill, on Carson river, 2 miles above Dayton, is being remodeled to such an extent that when the improvements upon it are completed it will stand as almost new. A new and powerful Lafelle turbine wheel is being put in, and 10 new stamps, thus increasing the crushing capacity of the mill to 50 tons per day. A new dam has been built and the height of the race increased 3 ft., giving 18 ft. of pressure upon the wheel. The mill will be in running order in 2 weeks.

Bacon and Trench mills, at Silver City, are building a large reservoir for holding water.

**DANEY.**—The main shaft is down 446 ft., and the drift from the 400-ft. station toward the ledge is in 111 ft. The rock works well, and both shaft and drift are progressing satisfactorily.

**SIERRA NEVADA BULLION.**—We yesterday saw a lot of gold bullion from the Sierra Nevada mine, valued at about \$8,000, and worth \$12 per ounce.

**SAVAGE.**—The ore yield for the last week was 475 tons, assaying \$31.15 per ton. The bullion receipts for Oct. footed up to \$81,000.

**COMSTOCK.**—We yesterday saw 25 large silver bricks, the greater part from the Crown Point and Belcher mines, which were worth over \$50,000.

**CROWN POINT.**—Gold Hill News, Nov. 14th: The drift south, at the 1,200-ft. level, shows continual improvement, and average assays of the ore from that level run about \$48 to the ton. Five mills are now engaged in crushing the ore from this mine.

**BRUNSWICK.**—Carson Register, Nov. 17th: The new Brunswick mill, with its 56 stamps and capacity for crushing 200 tons of ore daily, will be ready to start up by the 12th proximo.

#### WHITE PINE.

**SOUTH AURORA.**—White Pine News, Nov. 11th: Last week our report stated that the lower tunnel, running for the purpose of cutting the mineral belt 70 ft. below the old workings, had improved in appearance. The same spur body continues in the face of the tunnel. The Mitchell shaft, inside of the old works, is down 70 ft. A drift will be started from it to run South, connecting with the main tunnel mentioned above. After the connection is made, all the ore and waste will pass through it from the different works of the mine. The Turner shaft is down 71 ft. A drift is running southeast to strike the Trewella shaft.

**GENESSEE.**—The rock in the new shaft continues favorable for fair headway in sinking.

**EDGAR.**—Drifting east from the 100 ft. level.

**GREAT WESTERN.**—The new contract in west drift of upper shaft, is going on. The ore in sight at present is worth only \$6 to \$8 per ton, but rich chloride has been found in this locality.

**EAST SHEBOYGAN.**—The ore body has increased since last report in all the drifts, and in the East Exchange incline there is a stratum in the ore body 2 ft. thick, containing horn silver in abundance. The Oxford shaft, started a few weeks ago north of the old openings, is not yet down to ledge matter. After the Oxford is down, other prospecting will be carried north on the same line toward the point where it is proposed to commence the tunnel.

#### Arizona.

**MINES AND MINING.**—Arizona Miner, Nov. 4th: The excitement in mining circles continues. The Tiger rests, and awaits advent of capital to render its treasure available. The work of delving and drifting is, however, progressing as usual.

The scarcity of water has necessitated the suspension of work on the Del Pasco. Up to last week the mill had been running

192 hours, during which 42 tons of ore were crushed. Upon cleaning up this yielded \$2,200 in gold. Work will be commenced as soon as nature shall furnish sufficient water.

In the new discoveries in the vicinity of Prescott the ledges are small, varying from 12 to 18 inches in thickness, but almost incredibly rich. The average rock, taken from the surface, will yield \$1,500 to the ton; no piece of rock, from either the Cornucopia or the Bismarck lodes; tested, has yielded less than \$1,000 per ton, while selected specimens have yielded \$3,500. The rock presented by these lodes is precisely similar in character—of a grayish red color, with rock-crystal interspersed, and presenting chloride and horn silver at every fracture. The owners intend to commence work in these ledges immediately.

**WALLAPAI.**—The ore from the Lone Star and Empire lodes is constantly improving as the work of sinking progresses. A large quantity of ore from the Little Chief, was being shipped to S. F. and a greater quantity was still on hand, at the Empire and other lodes, awaiting shipment.

#### Colorado.

**BULLION.**—Colorado Miner, Nov. 9th: The total product of our mines for the month of Oct. is \$73,586.40.

The Stewart S. Reducing Co. have shipped since our last issue:

Brick No.	Oz. Silver.	Fine.	Coin Value.
367	117	754	\$1103.66
368	117	754	1103.37
369	119	745	1092.82
370	109	754	1071.41
371	104	754	1070.55
372	519	744	528.06
373	751	708	745.74
Also Lead Bars.	1046	390	527.39
71	939	390	473.44
			\$7,713.46

The mill is running mainly on Terrible second class ore.

Palmer & Nichols have shipped

Bar No.	Oz. Silver.	Fine.	Coin Value.
44	141.83	802	\$1152.07
45	148.85	638	1173.25
			\$2,706.32

The International mill, Argentine, has shipped

Bar No.	Oz. Silver.	Fine.	Coin Value.
20	1102	802	\$1,300.00

Total for the week, \$11,479.78.

**COMET LODGE.**—J. Smith and A. M. Graves have leased the west half of this lode. They have sub-leased 300 ft. of their ground—100 ft. to Repeal & Co. All the ground opened by these parties is furnishing first class milling ore, in considerable quantities. The last mill run of ore taken by Smith and Graves, gave a yield of 209 ozs. per ton. The ore now being mined out in all the workings of the mine, on the ground worked, is of better average quality than any ever before mined out. Mr. Repeal had an assay made of decomposed material taken from his ground that gave a yield of 1,480 ozs. per ton. All the ore we saw, and there were a large number of sacks, had a look of sulphurets of silver.

**CARIBOU.**—Cor. same: Fuller & Co. have lately discovered a lode, they call the Canadian, half a mile south of town, in a place considered barren of silver ore in paying quantities, yet this promises to equal any discovered in this dist. At 12 ft. they are taking out sulphurets of silver and a mixture of copper and zinc blende. The Seven-Thirty is again turning out the same high class of ore that made it so celebrated last spring.

Corning & Co. have let a contract to sink the Wahash 35 ft. This lode shows as well as the Caribou did at the same depth.

#### Idaho.

**THE COUNTRY NORTH.**—Idaho World, Nov. 9th: A basin has been discovered south of Warren's diggings but very little prospecting had been done. Mr. Hooton saw a prospect of 18 cts., which was creviced out of a seam in the bedrock of the main stream running through the Basin. Mr. Hooton brought in some specimens of quartz from a ledge in Deadwood Basin, which proved to be rich in both gold and silver, the rock being of a live character, hard and solid and not of a decomposed nature. We are satisfied that rich and valuable quartz discoveries will be made. Numerous ledges have been discovered, but very little work has been done on them; prospectors generally looking out for placer ground and paying little attention to quartz interests.

#### Montana.

**THE MINES.**—Deer Lodge Independent, Nov. 11th: At Highland all the arastras have suspended on account of the cold weather. Work upon the ledges is pushed forward with activity. The placer miners are mostly at work, but will be compelled

to shut down in a short time. At Moose Creek all placer mining has ceased, but Parks & Dicky are still running their arastras successfully. They will employ a force of men on their mines all winter, and expect to take out enough paying ore to keep 3 arastras running the ensuing summer. But few Co.'s are now running their mines at Pikes Peak and these will suspend in a few days. This is also true of the mines at Pioneer. In all the southern portion of the county, with the exception of German Gulch, mining has been stopped for the season.

**BEARTOWN.**—There is as much mining going on now as any time last summer. J. Hohhine lately sold a portion of his large claim at remunerative figures.

**BIO MINE.**—Helena Gazette, Nov. 6th: Some gentlemen have recently prospected, developed and pre-empted on the Big Boulder in Jefferson Co., one of the most extensive silver lodes in the world. The vein is sixty ft. wide, and 2 extensions have been made. The ore prospects well from one wall rock to the other.

**SULTANA WORKS.**—These works, consisting of 3 furnaces, are in American Fork Cañon, at the junction of Miller and the main cañon. They were built to work the ores of the Miller mine. The capacity, however, is sufficient to smelt all the ores that the mines in their immediate vicinity are expected to produce for the time being.

There are at present 15 hands at work on the Miller, raising 5 or 6 tons of ore per day. The dumps have now upon them ready for transportation to furnaces, upwards of 1,500 tons of ore, while 100,000 bushels of charcoal are under roof.

The hullion produced is worth 61.96 oz. of silver, 1.21 oz. gold to the ton, and 60 per cent. of lead.

#### Utah.

**LITTLE COTTONWOOD.**—Salt Lake Tribune Nov. 16th: A new body of ore was struck 2 weeks ago in the Emma, 600 ft. from the surface, apparently of great extent.

The Flagstaff is shipping more ore than any mine on the hill.

The Last Chance, near the top of the hill, is doing a large business in the shipment of ore.

The Davenport is looking well and has furnished considerable ore to the Hawkeye works in Big Cottonwood.

The great Wellington has several thousand sacks of ore in sight, and are erecting houses and sheds to enable them to continue work through the winter. The Creek lode, near this mine, shows very rich. The ore assays very high, and the prospects are, that it is plentiful.

The Charlotte lode, near the American Fork divide, is a "true fissure vein," having fixed wall-rock. The ore is very rich in silver, several of the assays running \$650 to the ton.

**AMERICAN FORK.**—Cor. same: The Sultana is running nicely. The Pittsburgh mine can produce at least 5,000 tons of free carbonate ore at a small cost. The lead is well defined. The Co. propose putting up a smelter at once. The ground at Deer Creek is surveyed, and the foundation commenced for a quartz mill; a smelter is to be put up at the mouth of this cañon, and large refining works at Lehi. The Waterloo mine, opposite the Miller, will be worked this winter. The Emeline, Conqueror, Champion and Chelsea, are old locations, and considered valuable. The Silver Glance is one of the best.

#### Mining Stock Market.

THURSDAY EVE., Nov. 23, 1871.

Stocks have fluctuated considerably during the period under review. They were in limited request on Friday, and the usual amount of business was done on Saturday, while on Monday they were moderately active. Since then they have been weak.

The Raymond & Ely Co. disbursed last Friday \$130,000 among the stockholders. The sales at the Stock Board for the week ending Wednesday, November 15th, amounted to \$2,221,000. Nearly 1,000 tons of ore were taken from the Chollar-Potosi mine last week, assaying \$42.45 per ton. The product from the Hale & Norcross last week was 1,250 tons of ore. On November account \$82,700 have been received from the Meadow Valley mine.

At the annual meeting of the Kentucky Mining Company, held yesterday afternoon, the following Trustees were elected: D. L. McDonald, J. A. Pritchard, I. G. Messec, J. N. Vimont and J. C. Maynard. Frank Swift was elected Secretary in place of J. L. King, resigned. At the beginning of the last fiscal year, the amount of cash on hand was \$6,145. The amount received from hullion product, premium and in-

cidental, was \$129,693. Two assessments of \$20,000 each, were also collected, making the total receipts, including cash on hand, \$165,828. The amount paid for labor and supplies at mine and mills, freight, exchange, etc., was \$140,674. The expenses at the office at San Francisco were \$4,892, and of the Gold Hill office, including salary of Superintendent, etc., \$4,892; miscellaneous, 855—making the total expenditures \$150,358, and leaving \$15,470 cash on hand.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The Globe says: "Various chemists and manufacturers have endeavored to equal the reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of the Maravilla Cocoa. Admiring their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other cocoa on the market. Entirely delicious, it contains a pure and rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocos above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homeopathic Cocoa and Soluble Chocolate. Sole Importers, Messrs. Miller, Brick Lane, London. Export Chocolate Mills, Bruges, Belgium. 1875-1876

N. Seibert's Eureka Lubricators for steam engines are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First Street, San Francisco. 8723-3m

## USEFUL INFORMATION.

## A New Product of Milk.

Every nation has a national drink—some alcoholic preparation that will intoxicate. The natural beverage is varied according to the circumstances of the case. The Mexican pulque, East Indian arrack, American corn or rye whisky, French brandy, is each produced from the vegetable productions of its particular country. But the nomadic tribes of Tartary which have no agriculture, and whose wealth consists of flock and herds—who are exclusively livestock men, in fact—have for ages "made drunk come" through the agency of a vile preparation of mare's milk called *koumiss*.

And now a movement is on foot for introducing this stuff into use in the United States and England. Cow's milk is used instead of the equine product of Tartary, but the article, which by the by, is made in Germany, is substantially the same as Oriental *koumiss*. We are told that "The result of the treatment is a mixture of alcohol, carbonic acid, lactic acid, and finely divided casein and butter, with the residue of the sugar and salts of the milk, in taste resembling a mixture of champagnes and cream, and supposed, as the Tartars are very athletic, to be conducive to health and a preventive of consumption."

But we can have no very sanguine wishes for this attempt to convert the bland lactical fluid into a vile alcoholic compound. It is bad enough that a large amount of milk is derived from the slops of the distillery, without sending the product back to be converted into alcohol.—*Live Stock Journal*.

**WHY GRANITE DECAYS.**—Dr. Roberts, an eminent French chemist, earnestly recommends the use of salts of copper as the best preservative against the injurious effects of a moist climate upon stone buildings; and endeavors to prove that the wasting away of sandstone and granite is due to various causes, one of the most important of which is the development of a minute lichen. This plant, says Dr. Roberts, is so destructive that the beautiful marble sculptures in the park at Versailles would be completely destroyed by it in the space of fifty years unless precautions were taken to arrest its ravages. He states that the amount of wearing away of rocks of all kinds, granite not excepted, is much greater than the public are generally aware of, especially when subjected to the influence of a moist atmosphere.

**WORK DURING SLEEP.**—These cases in which the brain is hard at work during sleep, instead of being totally oblivious of everything, may be called dreaming, or somnambulism, according to the manner in which the activity displays itself. Many of them are full of interest. Some men have done really hard mental work while asleep. Condorcet finished a train of mental calculations in his sleep, which had puzzled him during the day. In 1756, a collegian noticed the peculiarities of a fellow student, who was rather stupid than otherwise during his waking hours, but who got through some excellent work in geometry and algebra during sleep. Coleridge composed "Kubla Kahn" while asleep.

**A CHEAP GALVANIC BATTERY.**—A cheap galvanic battery has been described by Dr. Golding Bird, which, it is stated, can decompose water, and ignite charcoal. The mode of construction is to break the stems of six tobacco pipes, close the bowls, and close the apertures at the bottom of each bowl with sealing wax, get six small toy tumblers, about half an inch in height; put in each a cylinder of amalgamated zinc, and place in each pipe bowl, a thin slip of platinum foil, half an inch wide, and connect it with the zinc of the next cell with platinum wire; fill the pipe bowls with nitric acid, and the battery is complete. In case the platinum cannot be obtained, copper may be substituted. This battery is in imitation of the famous battery made by Faraday, out of a common tumbler.

**HOW TO SEE UNDER WATER.**—A writer in the *Scientific American* tells us how to see under water: "The Indians of North America do this by cutting a hole through the ice, and then covering or hanging a blanket in such a manner as to darken or exclude the direct rays of the sun, when they are enabled to see into the water and discover fish at any reasonable depth. Let any one who is anxious to prove this, place himself under a blanket, and he will be astonished when he beholds with what

a brilliancy everything in the fluid world is lighted up. I once had occasion to examine the bottom of a mill pond, for which I constructed a float of inch plank, sufficient to buoy me up; through the center of this float I cut a hole, and placed a blanket over it, when I was enabled to plainly discover objects on the bottom, and several lost tools were discovered and picked up. I am satisfied, that, where water is sufficiently clear, this latter plan could be successfully used for searching for lost bodies and articles."

## Consuming Smoke.

A great waste of fuel is inseparable from the manner in which most boiler furnaces are constructed. It is now over thirty years since attention was first called to this fact and devices applied to remedy the defect. If we are not mistaken, John Y. Williams, of Manchester, England, was the first person who gave a practical demonstration of the fact, that nearly all the smoke which consists of free carbon and escaping, ignitable gases, that passes off from furnaces, whether burning wood or coal, can be consumed—thus utilizing an enormous waste and converting a nuisance into a positive benefit.

Mr. Williams introduced air to the escaping gas or smoke by numerous small apertures in the fire bridge. The defect of this arrangement, however, was that

the air was not brought in contact with the escaping gases at the point when they are richest in unconsumed carbon, etc. Perhaps among the many improvements, none have been made more simple or more effective than the one shown in the plan roughly sketched below. Referring to the figure, A is an arch of fire tile between the fire and the boiler; B, a series of pipes forming air inlets, introducing numerous jets of heated air which strike the fire at its hottest part and where richest in free carbon.

In Manchester and other manufacturing towns of England—where the combustion of smoke is made compulsory by law—the smoke nuisance has been practically abolished, so far as the manufacturing establishments are concerned; greatly to the economy of the manufacturers themselves as well as to the general health and appearance of the city.

**FISH AS FOOD.**—A well known writer, on chemistry as applied to food, has made the statement, based on actual scientific investigation, that there is as much substance in a pound of salmon as there is in a pound of mutton. This fact alone shows the advantage to be derived from proper care and protection extended to our waters in stocking them with fish, and by proper laws, giving such care to the promotion of our pastures as to add to our resources, and thus reduce the present enormous high cost of beef, mutton, pork and veal, articles which every housekeeper knows are the real cause of the fearful charges of living.

A FRENCH chemist asserts that if tea be ground like coffee before hot water is poured upon it will yield nearly double the amount of its exhilarating qualities.

## GOOD HEALTH.

## Picking the Ears.

Dr. Hall says "picking the ears" is a most mischievous practice; in attempting to do this with hard substances, an unlucky motion has many a time pierced the drum; nothing sharper or harder than the end of the little finger, with the nail pared, ought ever to be introduced into the ear, unless by a physician.

Persons are often seen endeavoring to remove the "wax" of the ear with the head of a pin; this ought never to be done; first, because it not only endangers the rupture of the ear by being pushed too far in, but if not so far, it may grate against the drum, excite inflammation and an ulcer, which will finally eat all the parts away; especially if of a scrofulous constitution; second, hard substances have slipped in, and caused the necessity of painful operations to fish or cut out; third the wax is manufactured by nature to guard the entrance from dust, insects and unmodified cold air, and when it has subserved its purpose it becomes dry, scaly, light, and in this condition is easily pushed outside by new formations of wax within.

Occasionally wax may harden, and may interfere with the hearing; but when this is the case, it is the part of wisdom to consult a physician and let him decide what is the remedy; if one cannot be had, the only safe plan is to let fall into the ear 3 or 4 drops of tepid water, night and morning;

## Fat People.

Not long ago a gentleman of threescore, who had scarcely ever been sick in his life, thought he was too fleshy and began to Bantamize. He succeeded famously, and boasted to his friends that he had got rid of ten pounds in a few weeks. A little later he was attacked with a painful and dangerous malady, from which he has been suffering more than a year.

If a man can sleep soundly, he has a good appetite, with no unpleasant reminders after meals, the bodily habits being regular every day, he had better leave himself alone, whether he is big as a hoghead or as thin and dry as a fence rail.

Several causes of Bright's diseases have been reported by medical men of reputation as a direct result of practicing Bantam's plan for getting lean. The very best and safest way to get rid of fat is to work it off. This may be aided by eating food which contains a large amount of nitrogen and a small amount of carbon.

Nitrogen food is that which gives strength, power to work, as lean meats; carbonaceous foods are those which make fat, such as cheese, potatoes, rice, corn, peas, beans, tapioca, arrowroot, cornstarch, milk, sugar, syrup, and all oily and fat food. Raw fruits and berries largely eaten are great aids to reducing weight.

But, after all, the great reliance should be on exercise and work in the open air. Barclay, the great English pedestrian, who performed greater feats than Weston, lost ten pounds in two or three days' walking, and was never the worse for it.—*Hall's Journal of Health*.

## INTERMARRIAGE OF BLOOD RELATIONS.

Prof. Richard Owen, L.L.D., A.M., of the Indiana State University, stated an important fact which cannot be too widely disseminated, namely: that in the intermarriage of blood relations is a physiological error, and he might almost say, with our knowledge of such matters, a crime. Speaking from a close observation of this subject for many years of all the families of his acquaintance where close intermarriages had been permitted, the children were either deaf mutes or were afflicted by some deficiency. He knew a young man whose father was a physician, and who should have known better than to marry a double-cousin, but the consequence was, as the last portion of the osseous system developed, the young man from the intermarriage of those in whom the same material was deficient, was prevented from having a single tooth at any period. His sister had but two or three small stubs of teeth, and their brother was altogether deficient in his mental faculty. He insisted that it was a great crime for parents to allow their children to grow up with the idea that they might ever intermarry with blood relations. It should be a thing never to be thought of, the intermarriage with those connected by ties of consanguinity.

Mr. Ferguson knew of a case in Ohio, where some thirty families had married and intermarried until they could no longer tell their relationship. Most of the progeny were deaf mutes, and the remainder a little above idiotic.

**LAZINESS AND LONG LIFE.**—The lazy groan most over their "arduous duties," while earnest workers talk little about the exhausting labors of their profession. Of all creatures, the sloth would seem to be the most wearied and worn. "He that is slothful in his work is brother to him that is a great waster"—first of all of health. Said Dr. Humphrey, for twenty-two years the President of Amherst College, and who reached the age of eighty-two: "I have yet to see the man who died from the effects of study." Kant, an indefatigable student in the most profound themes of metaphysics, and leader of a new school in philosophy, lived beyond the limits of three score and ten. As the result of his experience and wide observation, he was wont to say: "Intellectual pursuits tend to prolong life." He placed great reliance on the power of cheerfulness and will in resisting disease. "Be of good cheer," is as wise a prescription for the health of the body as of the soul.

**BREATHING FOUL AIR.**—When breathing air that is dirty, ill-smelling, or otherwise impure, the breath should be drawn in slowly through the nostrils—never through the mouth. In this way the dust and other impurities are mostly lodged in the passages of the nostrils from which it is readily expelled, and kept from the lungs. People ought always to breathe through the nostrils. A person's life is, in almost all cases, thereby greatly lengthened.

**TO STOP THE BLEEDING FROM LEECHES.**—Make a ball of cotton about the size of a pea; put this pellet of cotton or lint upon the wound; press it down firmly; keep up the pressure for a quarter of an hour. Remove the finger cautiously taking care to let the pellet remain.

## Notices to Correspondents.

ED. PRESS:—Dear Sir, I herewith send you a sample of wool, which I have just pulled from a species of wild animal, inhabiting the high and rocky mountains of this Territory. I send you this sample, that it may be examined by competent judges as to its value, etc. J. C. ROBINSON, Deer Lodge City, Montana, Oct. 20, '71.

The sample of wool sent us is of but little value, from the fact that it contains a quantity of kemp or long hair, which will not work up into the fibre of cloth. The animal from which it was taken, is commonly called the mountain goat, but is a species of antelope (*Aplocerus Montanus*), which inhabits the elevated plateaus and remote fastnesses of the Rocky Mountains. This hair or wool might perhaps be used with the coarser kinds of common wool in Eastern factories, in the manufacture of the roughest class of goods, if it could be obtained in sufficient quantities; but it is worth nothing in the California market.

GYPSUM.—"W. F. A." There is but little demand for gypsum in this city, and the market is at present overstocked with a very excellent article from Lower California. Farmers in this State have not yet learned to appreciate its value for manurial purposes. It is employed to a limited extent, in Washington Territory, for the purpose of killing off the sorrel, which grows very rank in many localities in that Territory, to the great annoyance of the farmers. The time will come when gypsum will be appreciated here as well as at the East. It is much more valuable in a dry than in a wet climate; the reasons for which we will give in some future number of the Press, for the information of our readers generally.

## Yield of the Precious Metals.

The experience of the past few years has led to vast improvements in the methods of extracting and reducing gold and silver ores, and there are ample assurances that those who now invest in mining enterprises may avail themselves of a more thorough knowledge of the business than formerly. The mineral wealth of the nation is almost unbounded and the yield of the precious metals is gradually increasing. We believe no authentic account is kept of the amount of hullion sent East by railroad, but there is little doubt that if it could be definitely ascertained, and the amount added to that received at San Francisco, the product would be found considerably larger than in past years. The yield of the precious metals is also receiving a decided stimulus from the constant accession of European capital. In fact, it is estimated by good authorities that the low rate of interest in New York and Europe is the legitimate result of the increased annual addition to the supply of gold and silver.

The Atlantic States which have yielded gold in workable quantities are Virginia, the Carolinas, Georgia, Tennessee and Alabama. In 1829 the first deposit of gold from Virginia was made in the mint, the sum deposited being \$2,500. From that period up to 1861, from \$50,000 to \$100,000 were taken out annually, and the net yield for the whole time may be set down as considerably over \$1,500,000. From 1864 to 1867, North Carolina furnished all the gold of the United States, amounting, according to the returns at the mint, to \$110,000. The aggregate of all her gold yield up to 1860, according to official data, is about \$9,300,000. Gold mining began in South Carolina in 1829, since which returns have been made to the mint of \$1,354,000. Georgia has yielded a total product of \$6,971,681, Tennessee only about \$81,500, and Alabama \$201,735 since 1838. The products of the Atlantic States may thus be set down at \$19,500,000 returned to the mint, though a considerable amount probably passed unnoticed directly into commerce.

The total product of gold and silver in the United States for the year 1870, as estimated by Mr. R. W. Raymond, United States Commissioner of Mining Statistics, reached \$66,000,000; California contributing \$20,000,000 and Nevada \$16,000,000 to this amount.

The great sources of supply for the past twenty-two years have been on this side of the Rocky Mountains. Since 1848 the Pacific States and Territories have yielded about \$1,400,000,000. In a letter to the *London Times*, J. Ross Browne says the Comstock lode, Nevada, has produced in 10 years \$120,000,000, and has paid \$30,000,000 in dividends. Grass Valley, California, has yielded \$30,000,000, of which \$15,000,000 may be placed to account of profit. Gold Hill alone produced \$7,000,000—two-thirds of it profit; the Eureka mine has netted \$1,500,000; the Allison Ranch, \$1,000,000; Hayward's mine, in Amador, \$6,000,000 gross—probably \$4,000,000 net; the Sierra Buttes has paid in dividends \$1,200,000; and various other mines in California and Nevada are producing dividends of 30 to 40 per cent. a year upon the capital invested.

When the present mining appliances come to be supplemented by more effective methods for bursting the mountain barriers, our annual supply of the precious metals will, without doubt, be many fold greater than the present; since, from our untold wealth of precious metals, the energies of the nation are likely to be turned more and more to its gold and silver-bearing possessions.

THREE Belgian noblemen are making a tour of Oregon.

## OUR HOME INDUSTRIES.

The various branches of industry and home manufactures, merit the attention of the people and the press, to a greater extent than is usually conceded; while every one is proud of the enterprises daily increasing and spreading all over our thriving State, we do not pause to encourage and credit the originator and leader of these several enterprises, half as often as they deserve. We shall look among the various branches of our home manufactures, and report from time to time, whatever seems to be of interest.

### The Standard Soap Company,

whose establishment is at Nos. 204 and 206 Sacramento street, extending through to Nos. 207 and 209 Commercial street, have the most complete soap manufactory in the State. They make from 40 to 50 varieties of fancy and toilet soaps, and about 20 kinds of family and laundry soaps. They use California tallow almost entirely, and consume large quantities of native soda from Nevada. They also make large quantities of Madame Balcar's vegetable washing fluid from California soap-root. This fluid, which is manufactured by a patent process, is used for all the purposes for which ordinary soap is employed, and is especially valuable in cleansing crockery, glass, silver and paint. It is also used extensively on steamers, for cleaning the machinery, scrubbing the decks, etc. The soaps made by this company are of the better qualities, finely scented, and are guaranteed equal to the best Eastern brands. Their machinery for making toilet soaps comprises the most recent improvements, and their perfumes and essential oils are imported direct from France. Their cocoa nut oil soap is made of pure cocoa nut oil, brought from islands in the Central Pacific. They also manufacture a novel kind of harness soap, which at once oils, blackens, and polishes the harness. The soap of all kinds is out upon wire frames and the cakes of the finer qualities are then stamped and polished by the most improved presses. The candle factory, belonging to this company, was destroyed by fire some time since; but will probably be re-built. The demands upon this company for soap supplies are not confined to local trade; they ship large quantities to China, Japan, Mexico, Tahiti, Honolulu, and the entire Pacific slope, and as far east as Utah. The greatest demand is for their best grades of soap and washing powders.

They have readily taken the first premium at several of the Mechanics' Fairs, State Fair, and at the Santa Clara Valley Fair. Too much cannot be said in praise of the Laundry Blue—its purity as a bluing, its economical qualities and labor saved in the use of it.

The castile soaps manufactured by the Standard Company are worthy of special notice.

The amount of washing powder made and sold in San Francisco, by rude estimate, must be in the neighborhood of six or seven hundred thousand pounds. In 1867, the amount manufactured was over three hundred thousand pounds; and the various establishments manufactured the same year over three and a half million pounds of soap.

The soap plant, native of California, called Amole, was considerably used by the Indians and Spanish Californians, before the country was known to Americans. It has a stalk five or six feet high, with branches about 17 inches long, which are covered with buds that open in the night, commencing at the root of the boughs, about five inches at a time. The next night, another set of buds open, and so continue night after night. It is found in the valleys in increasing quantities southward. A variety of the same plant is found in some of the basins of Idaho. The bulbous root of this plant, when rubbed

in water, makes a lather like soap—it is also considered a fine wash for sheep, by the Mexicans, who used to gather it and use it for that purpose.

### Mission Candle Works.

Messrs. Winter, Maurer & Co., have recently established on Sixteenth street, opposite the Mission Woolen Mills, a large and extensive candle and soap manufactory. The candles made by them are the chemical wax and solar sperm, and are a very superior article. They were awarded a gold medal for their exhibition of candles at the late State Fair, by the committee appointed for that purpose. The most of the tallow consumed is obtained from Australia and Chicago; and from fifteen to twenty tons is used weekly in the manufacture of, from one thousand to twelve hundred boxes of candles. Two of the largest hydraulic presses in use in any factory of the kind in the United States, are employed to press the oil out of the tallow, one being of a pressure of five thousand, and the other of ten thousand pounds to the square inch. Over 400,000 boxes of candles are imported into California from the East annually; but eastern manufacturers usually send their surplus to this State, which is often an inferior article. The candles made at this establishment are chiefly intended for use in minis, as they are hard-pressed, and do not run. The oil pressed from the tallow, in eastern candle factories, is used in other industries, which do not exist in California; but, at these works, the oil is made into an extra article of soap. From forty-five to fifty thousand pounds of soap are made per week, which finds a ready sale, as well as all the candles manufactured.

### Garratt & Co.'s Bell Foundry and Brass Works.

This establishment, which was burned down on the 22d of last July, has just been rebuilt, on the corner of Fremont and Natoma streets. Mr. W. T. Garratt, who is a pioneer in the brass foundry business in this State, has been burned out three times; the last time with a loss of near \$100,000. His new establishment is thoroughly fire-proof, as well as earthquake-proof, and he has no fear of future conflagrations. The walls of the three buildings, which comprise the works, are of a brick, and are of the heaviest and most substantial character; and are girded and anchored with iron bars. The front is of iron, the doors are of the same material, and the windows will be fitted with iron shutters. The buildings are divided by fire-proof walls, and are entirely distinct from each other. The interior is being fitted up in the style of eastern manufactories, and the establishment when completed, will be by far the finest one of the kind in the State. Operations have been commenced in some of the departments, and two heavy furnaces are in process of erection. The most improved kinds of machinery are being received from the East, and put up as fast as they arrive. When in full running order, forty lathes will be in operation, in the machine shop. The number of workmen employed in the different departments, including the foundry and pattern shops, is about sixty. The establishment is intended to manufacture bells, brass work and all kinds of light machinery. Taken all together, it is first-class throughout, and is a credit to the State.

### California File Manufacturing Company.

This company have recently removed from Brannan street to the Potrero. The works are under the superintendence of Mr. T. G. Durning, the pioneer in the business of file making in California, and who claims to be the only practical file maker on the coast. The material used in the manufacture of the files is steel, imported from England for that purpose; tool cast-steel being too brittle for this use. This imported steel takes a better temper, and is harder and tougher than ordinary steel. It comes in bars of the proper sizes for the different classes of files. These bars are cut into required lengths, which are then forged into shape. By the use of a trip-hammer, one man will turn out about fifty dozen of 14-inch files per day. They are next placed in an air-tight furnace, between alternate layers of charcoal, and heated slowly to a cherry red, and then gradually cooled, and thus annealed; after which they are straightened and ground. They are then cut, and tempered in a crucible of melted lead, and cooled off in a large tank of cold water. After this process, they are cleaned and oiled, and are ready for the market. Old files are also re-cut and warranted.

This establishment also makes reaper and mower sections, with bars and knives complete. They claim to furnish all their work at from 40 to 50 per cent. less than the imported articles.

### The Gravel Hills of Placerville.

Whenever the pioneers of this State hear the "flush times" of California spoken of, they are unconsciously carried back by the wings of memory, to the "days of old, the days of gold, the days of '49," and they remember the flourishing town of Placerville as it was then, a bustling, lively, merry place, crowded with rough red-shirted miners, all eager in their search for gold, with still room for the more generous feelings which characterize the Californian the world over. Most all who were here in those early days visited Placerville and its famous mines, and even among those who did not, the local names of the vicinity are familiar as household words. The county in which Placerville is situated does not occupy as enviable a position as it then did, although it was here that the discoveries were made which led to the opening of the gold fields of the Sierra, causing a great influx of adventurous spirits to our shores, who soon poured the hidden millions into the treasures of the world.

The superficial deposits of auriferous gravel were soon washed away and their contents made available, and it was not for some time that it was discovered that extensive and valuable deposits were to be found at levels above the course of the present streams. Then the hydraulic process was introduced, a system peculiar to California, and the bodies of auriferous cement and detritus were attacked by its agency, and are still successfully worked either by that process or under stamps. These deposits are situated in various parts of the hills in the vicinity of Placerville, and furnish an interesting field for the geologist, and a profitable one for the miner and prospector. The attention of our English capitalists has been turned to these extensive mines, and it was only last week that we noticed in one of our English exchanges the incorporation of a company for the purpose of purchasing and working one of these claims, whose capital stock was \$2,000,000. An interesting article appeared recently in the columns of the *Mountain Democrat*, under the above head, which was written by W. A. Goodyear, of the State Geological Survey, and we now propose condensing from it, and selecting some of the points which may be of general interest.

The structure of the banks which enter into the formation of this extensive gravel range is varied and complex, and the questions as to their origin, exact mode of formation, and distribution of the gold which they contain, are intricate, and difficult to solve. A careful and detailed investigation of these deposits has developed some points of interest, among which the first is—as to the quantity of gravel exposed. No attempt has yet been made to form any definite estimate of the number of cubic yards, and from the nature of the case, the hills being irregular in form and outline, and the distribution of the gravel being also irregular, it is impossible to make any without full topographical surveys of the ground. Even the results would be uncertain, on account of the varying ratio which exists in different hills, and even in different parts of the same hill, between the gravel itself and the volcanic matter which often overlies it in heavy masses. It is perfectly safe to say, however, that this quantity is great; amounting, in the aggregate, to many millions of cubic yards.

One peculiar feature in the character of the gravel formations in this vicinity, is the presence of such immense quantities of a true volcanic gravel, well known to the miners here under the local name of "mountain gravel." Ninety-nine per cent. of all the pebbles and boulders which it contains, and probably more than 90 per cent. of its whole mass, consists of matter which is volcanic in its origin. Yet the material is a perfect gravel, and its pebbles are as smoothly and perfectly rounded by water, as the pebbles of any bank of auriferous metamorphic gravel in the State.

Another point of no less interest to the geologist than to the miner, is the fact that it contains fine gold, distributed appar-

ently through its whole mass even where it is 75 feet or more in thickness; and this, too, not in appreciable quantity, but in sufficient quantity so that at various localities, where large heads of water have been used, it has paid "wages and water money" for piping it off, even at the present high prices for water. This fact, taken in connection with the occasional pebbles of quartz, and metamorphic rocks which are sparsely distributed through it, proves that the stream which brought it here, though flowing mainly at the time over volcanic matter, nevertheless, at some point of its course, flowed over the naked bed-rock, or else over or through beds of previously deposited auriferous gravel, from which it gathered this fine gold. Beside this, and the metamorphic or true auriferous gravel, there are two other well marked substances which make a large part of the formation of these hills, both of which are volcanic in origin. They are locally known by the miners here under the respective names of "black lava" and "white lava," or white cement. The term lava, however, is not strictly applicable to these substances for though almost exclusively made up of volcanic matter they are not entirely so, and furthermore they have never reached here in the condition of "lava flows"—i. e. of streams of volcanic matter rendered liquid by heat and flowing in this condition over the country; but on the contrary they have both of them been brought and distributed here in the solid

APPLICATION OF DUTTON'S IMPROVED HARNESS.

state in the condition of broken and more or less angular fragments and comminuted particles, chiefly, if not entirely, by the agency of water.

The "white lava" is a consolidated mass of moderately fine grained and nearly white volcanic sand and ash, almost entirely free from pebbles or larger fragments of any kind, although it does occasionally contain very small and more or less water-worn pebbles of quartz and slate rock. Its grit is very sharp and it contains more or less mica. Its localities are numerous throughout the range occurring in some places in very heavy masses as on the south side of Wehner Hill and near the head of Cedar ravine; also at Prospect Flat and especially near the toll-house just above Smith's Flat, and in the high bluff overlooking the road just above the toll-house. At the latter point its vertical thickness is probably more than 200 feet. It varies greatly in hardness at different localities, the quality used as a building material dressing easily and well. Its internal character and texture exhibit plenty of evidence that it was originally deposited here in the condition of loose volcanic sand, which has since become more or less perfectly consolidated into a rock.

[To be continued.]

### Foundry Work at Sacramento.

The Union Foundry of Messrs. Williams, Root & Nielson, has lately completed a fine 40-stamp mill for the Amador M. Co., of Amador City, Amador Co., Cal. The stamps are of 750 lbs. weight. A self-feeding apparatus, called the Hitchcock device, will accompany the batteries. One of Brodie's rock-crushers with 10x18-inch opening and weighing 7,100 lbs. will be employed. Also, three 24-foot revolving settlers. The whole will be run by a small turbine, (of Eastern manufacture,) submitted to a very high pressure of water.

Everything is expected to be in running order, on the ground, about the first of December. Mr. John A. Faullis Supt. of the mine. [Since the commencement of this mill, two prominent members of the company have died—Messrs. Geo. Bonner and W. E. Barron.]

This foundry has also turned out a 20-stamp mill for the Philadelphia M. Co., of Drytown. Weight of stamps, 625 lbs. Run by hurdy-gurdy wheel.

The iron work for Judge E. B. Crocker's magnificent fire-proof art gallery is now being cast here. [We understand the Judge has nobly determined to favor the public with a view of his rare collection of paintings during two days of next week.]

The proprietors inform us that there is a sensible improvement in orders for mining machinery lately. Sawmill construction is a specialty, while general repairing embraces a wide range at this shop.

### Dutton's Improved Harness.

The accompanying cut illustrates the practical application of Dutton's improved harness which we described in full in our issue of last week. The principal objects

attained by this improvement are preventing choking, relieving pressure on the veins and neck, and relieving the horse from any distress in pulling, by placing the draft strain on the sides of the neck, saving the neck from galling or chafing and the mane from wear. The harness has received diplomas at all the fairs where it has been exhibited. Mr. John Ashton of Tomales, Marin county, Cal., will give further information in regard to it to those wishing it, as he is authorized to dispose of rights for its manufacture and sale.

LUBRICATING OIL Co.—Among the number of recent inventions on this coast, we would call the attention of our readers to a late patent, entitled "Gruber's Lubricating Oil," manufactured and put up for the market, at the corner of California and Market streets, in this city. It will be seen by a reference to our advertising columns, that it is claimed to be superior to any other oil in use, for printing presses, wagons, carriages, and all classes of machinery, whether used on the farm or in any of the mechanical arts. We understand that samples have been tested by prominent printing and manufacturing establishments in this city with the most satisfactory results. We are informed by the printers, who made a trial of the sample sent to us, that it performs all that is claimed for it, that it does not gum, while it keeps the press cool and clear, and in first-rate running order. It is well worthy of a fair trial.

R. G. SNEATH of this city has distributed 1,000 ramie plants gratuitously among the farmers from all parts of the State.

### Recent Mining Discoveries.

A rich vein of gold and silver-bearing quartz has been discovered in the hills about 30 miles southeast of Dayton, Nevada. It assays very richly, and shows considerable free gold.

A rich quartz ledge has been discovered in Rock creek, Nevada county.

A large lake which recently ran dry in Surprise Valley, has left upon the bottom a bed of superior salt, clear as crystal, from four inches to a foot in depth, and covering an area of fifteen miles in length by six miles in width. Sheriff Burgess, of Siskiyou county, brought a sample to Yreka, which is pure and clear, and he says that toward the center of the dry lake it is even nicer looking than this. The people are busily employed with teams and wagons gathering up the salt and storing it away, no less than ten teams and wagons being in use when Burgess left, leaving small dark spots on the vast white surface, which appeared like snow on the ground.

The Yale College Exploring Expedition, under Professor Marsh, have made interesting mining discoveries, in the Blue Mountains, of Eastern Oregon, and John Day Valley. They also found many new species of extinct tropical animals; of the tertiary period.

### Mining Accidents.

On November 20th, Bast Cronin, a man employed in the construction of the large reservoir back of the Yellow Jacket works, Gold Hill, was attempting to raise a heavy timber, when it accidentally fell over upon him. His left collar bone and shoulder were badly broken, and a portion of one of his ribs forced in upon his lungs. His injuries are so serious that his attending physician thinks he will die.

On last Sunday night, a workman at Gwin's mine, Mokelumne Hill, by name Alphonso Collet, fell from the ladder, a distance of 100 feet, and received fatal injuries. He also struck two men while falling, severely injuring one of them upon the head and the other upon the back.

### The Tin (?) Discoveries.

Specimens of ore supposed to contain tin, from Utah Territory, have been subjected to careful chemical analysis at the General Land Office at Washington, and assays have been made by competent assayers in this city, and no trace of tin has been discovered. Those who made the first assay of this ore, and pronounced the substance in question tin, must have been either very careless, or else they knew nothing about it. It may be excused in many, however, from the fact that that metal is scarce in this country, and perhaps they may never before have had an opportunity of experimenting and becoming familiar with the ore. Some say it is Columbite, and now the general impression seems to be, according to the telegraph, that it is Cadmium; but, until further proof is given, in view of the previous mistakes, parties should be careful of investing in any Tin or Cadmium stock. A circumstance in our recollection serves to strengthen our incredulity.

A few years since a chemist found a deposit of infusorial earth, and in a subsequent analysis of it he found that hydro-sulphuric acid gave him a yellow precipitate which he knew must be either arsenic or cadmium. He then examined the original substance for arsenic alone and found none, so he assumed the precipitate to be cadmium. In the earth itself, he found silica and nothing else, so he called the substance "Silicate of Cadmium." He afterwards found out, after proclaiming his discovery, that the acid he used to acidulate with, contained arsenic, it being impure, which caused his mistake. We hope our friends who are testing this ore will be particularly careful in their work, in consideration of the interest in the result. We would like to see some of this remarkable ore.

## DOMESTIC ECONOMY.

### To Preserve Hams and Bacon.

After the ham or bacon is well cured and smoked, it will keep any reasonable length of time, provided it can be kept altogether free from the hane of this class of provision, the skipper fly. This little insect will puncture anything that is not as hard or impenetrable as leather, and if its ovipositor is long enough, will lay a perfect nest of eggs in the meat enclosed in the covering. When this fact is once ascertained and acknowledged, we can readily contend with its ravages.

To do this with certainty, take thick brown paper and envelope the meat entirely, covering every part so completely that no one portion is exposed; tie it on firmly with twine; then slip the ham or piece of bacon into a factory cotton bag, and hang it up in a cool, dry place. The fly will be "round" very shortly, and would deposit its eggs in the ham, although enveloped in cotton; but the substratum of strong brown paper prevents it from doing so, the ovipositor is not long enough to reach through cotton and paper, especially when the paper is inside the cotton. The insect, however, would soon remedy this difficulty by finding out an interstice in the paper, through which it could crawl, and in which it could do any amount of mischief; but the cotton bag prevents it, as it cannot possibly crawl through any of its interstices, consequently the meat enveloped in the paper inside is quite safe. Many recommend whitewashing the bag, or sewing hams up in cotton cloth, and whitewashing each completely. This is effectual enough if there are no cracks in the plaster or the slightest opening in the bag, through which the ovipositor can be passed and the bacon reached. Generally, however, there are plenty of such cracks or openings, and the insect will readily hunt for and find them. There being no defence inside of this bag as the paper above recommended, therefore there exists no difficulty in reaching the meat, and the first thing we know is that our hams are spoiled, and also the cotton in which the ham was sewn up, for they cannot, after being whitewashed, be again used.

**NATURAL PERFUME.**—A small, wide-mouthed glass jar, such as used by museums for specimens of natural history, should be filled with ether, and closed with a glass stopper dipped in glycerine to thoroughly exclude the air. Fill this jar during the season with the fresh blossoms of any fragrant plant, cut, after the dew is dry, and stripped of leaf and stem as well as calyx. The petals alone of roses, violets, tuberose or pinks should be used; heliotropes should be cut close to the panicle of bloom. Of course a jar is allotted to each kind of blossom. The ether has the property of taking up the fragrant particles from flowers, and when evaporated, leaves the essential oil of the plant behind, a very few drops of which in deodorized alcohol gives a delicious extract. Quantities of flowers are required, and the petals in the jar should be changed for fresh ones every day. Only skill and patience will succeed in the perfumer's art; but one success is worth many failures.

**GRAPE JELLY.**—Take ripe, juicy grapes, pick them from the stems; put them into a large earthen pan, and mash them with the back of a wooden ladle, or with a potato masher. Put them into a kettle (without water), cover them closely, and let them boil for a quarter of an hour, stirring them up occasionally from the bottom. Then squeeze them through a jelly-bag, and to each pint of juice allow a pound of loaf sugar. Dissolve the sugar in grape juice; then put it over a quick fire, in a preserving kettle, and boil and skim it twenty minutes. When it is a clear, thick jelly, take it off, put it warm into tumblers, and cover them with double tissue paper cut to fit the inside. In the same manner you may make an excellent jelly for common use, of ripe fox grapes and the best brown sugar; mixing with the sugar, before it goes to the fire, a little beaten white of an egg; allowing two whites to two pounds of sugar. —Miss Leslie's Cook Book.

**HOW TO BURN KEROSENE WITHOUT DANGER.**—Cram the wick into the lamp, fill up the interstices with sponge, and saturate the whole thoroughly with kerosene; as long as any oil remains in the wick the lamp keeps burning, and no danger need be apprehended from upsetting and even breaking the lamp. A lamp so used is perfectly safe.

**TO PREPARE SKELETON LEAVES.**—A solution of caustic soda is made by dissolving three ounces of washing soda in two pints of boiling water, and adding one and one-half ounce of quicklime, previously slaked; boil for ten minutes, decant the clear solution and bring it to the boil again. During ebullition add the leaves; boil briskly for some time—say an hour—occasionally adding hot water, to supply the place of that lost by evaporation. Take out a leaf, and put it into a vessel of water, and while there rub it with the fingers. If the epidermis and parenchyma separate easily, the rest of the leaves may be removed from the lye and treated in the same way; but if not, then the boiling must be continued for a time longer. To bleach the skeletons, mix about a drachm of hypochlorite of lime (bleaching powder), with a pint of water, adding sufficient acetic acid to liberate the chlorine. Steep the leaves in this till they are whitened (about ten minutes), taking care not to let them stay in too long, otherwise they are apt to become brittle. Put them into clean water and float them out on pieces of paper. Lastly, remove them from the paper before they are quite dry, and place them in a hook or botanical press.

**HOW TO JUDGE THE QUALITY OF PETROLEUM.**—Good petroleum should have the following characteristics:

1. The color should be white or light yellow, with blue reflection; clear yellow indicates imperfect purification, or adulteration with inferior oil.

2. The odor should be faint, not disagreeable. The specific gravity at 60 Fah., ought not to be below 0.795, nor above 0.84.

3. When mixed with an equal volume of sulphuric acid of the density of 1.53, the color ought not to become darker, but on the contrary, lighter.

A petroleum that satisfies all these conditions, and possesses the proper flashing point, may be set down as a pure and safe article. To test the color, care should be taken to select a glass bottle of good quality, perfectly white and clear. —Ironmonger.

**BUCKWHEAT CAKES** are an almost universal favorite at the winter breakfast table. Nature seems to crave them more at that season than any other, the reason for which scientific investigation has made very plain—they abound in those elements by which Nature most easily keeps up the animal heat of the body. Buckwheat is moreover very nutritious and will keep away hunger longer than almost any other food we can eat. A distinguished Judge of the Supreme Court once said that when he took buckwheat cakes for breakfast he could sit on the bench the whole day without being uncomfortably hungry; but if the cakes were omitted he felt greatly in need of a lunch by one o'clock.

**HONEY AND CREAM—ANGEL'S FOOD.**—Honey alone is considered quite delicious enough, but with the addition of cream, it is almost beyond description, and so far from being made too rich, it can then be eaten by many with whom honey otherwise disagrees. It is the most delightful dish I know of, if I except one called "Angel's Food," made of oranges peeled, cut in slices, and between each layer sprinkled with desiccated cocoa nut and sugar—to stand an hour or two then eaten with cream. In all cases orange and lemon seeds must be carefully removed, as they destroy everything by their bitter flavor.

**EXTRACTION OF PERFUME FROM FLOWERS.** In the season for extracting perfume from sweet flowers, gather quantities of rose leaves, sweet geraniums, heliotrope blossoms, carnations, sweet peas, and any fragrant flowers. Place them in a small earthen jar and strew salt plentifully between the layers of leaves and flowers. Set the jar in the cellar tightly covered up and let it stand for six or seven weeks. Then uncover it, and strain out through thin muslin all the liquid that is in it, squeezing the flowers thoroughly after the first straining.

**RENDERING BOOTS WATER-PROOF.**—The *Irish Farmers' Gazette* gives the following recipe for this purpose: Boil one quart linseed oil, with half a pound Venice turpentine, with which paint the leather frequently while warm, but not hot, till the leather will absorb no more.

**A NEW FLOUR PEST.**—A Western paper complains of a new pest worm in flour intended for domestic use. A black bug, a quarter of an inch long lays eggs in the flour which hatch in about ten days.

All knowledge is not in books; therefore cultivate a habit of observation.

### Domestic Receipts.

**STEAMED PUDDING.**—Two eggs, two teacupfuls of sour milk, one teaspoonful of soda, a little salt, flour enough to make it quite thick, or it will be heavy. Beat this smooth. Add cherries, raspberries, currants or any dried fruit you may have. Steam two hours, taking care that the water is kept over the pudding or bag all the time, and that it does not stop boiling. Eat with cream and sugar, hard sauce, or any liquid sauce you may prefer.

**QUAIL PIE.**—Prepare puff-paste as for chicken pie, and cover the bottom of the baking-pan with it. Parboil the birds and cut through the back. Place them in the pie breast to back, ski down; sprinkle over them pepper, salt and a dust of flour, and add for ten quarts a cup of melted butter; pour in as much of the broth in which the birds were boiled as it will hold, and cover with a top crust, cut a gash in the top and bake in a brisk oven.

**POTATO PAN PIE.**—Take four or five large sweet potatoes, cut in small pieces and boil till cooked through; pour off the water and put them in baking dish; then put in three heaping tablespoonfuls of sugar, a tablespoonful of butter, a little nutmeg, and last a cup of cold water. Make a crust like pie crust, only thicker and just large enough to cover the dish; cut a slit in the crust and put it on top of the potatoes and bake till a light brown. This dish is not a fancy one for a light dessert, but a good substantial part of a meal, and is pronounced excellent.

**TEA-LEAVES** are a remedy for hurns and scalds. A poultice of tea-leaves applied to small burns and scalds, afford immediate relief. The leaves are softened with hot water, and, while quite warm, applied upon cotton over the entire burned surface. This application discolors and apparently tans the parts, and removes the acute sensibility and tenderness.

**HORSERADISH SAUCE.**—One teacup of grated horseradish, one wineglass of good cider vinegar, into which has been dissolved a dessert-spoonful of loaf sugar, the same of mustard, a teaspoonful of salt; stir this to the horseradish. Serve with hot or cold meats.

**BEEF KIDNEY** should be parboiled; cut in small pieces, seasoned highly with pepper and salt. Serve with tomato sauce.

### Mechanical Hints.

**NON-SMOKING CHIMNEYS.**—To build a chimney so that it will not smoke, the chief point is to make the throat of the chimney not less than four inches broad and twelve inches long; then the chimney should be abruptly enlarged to double the size, and so continued for one foot or more; then it may be gradually tapered off as desired. But the inside of the chimney, throughout its whole length to the top, should be plastered very smooth with good mortar, which will harden with age. The area of a chimney should be at least half a square foot, and no flue less than sixty square inches. The best shape for a chimney is circular or many-sided, as giving less friction (brick is the best material, as it is a non-conductor), and the higher above the roof the better.

**TO LINE OIL PAINTINGS.**—Take a piece of unleached cotton cloth and stretch upon a frame, and size it with a weak size. When dry take ¼ oz. spirits turpentine, 1 drachm of camphor dissolved in 4 oz. of cold drawn linseed oil; add 2 oz. white lead, 2 oz. amber and 4 oz. finely washed and dried whiting. Mix all together; apply to the cloth, rubbing it in well; after the second coat, pumice down smooth. Then give the back of the picture a coat, and pumice that; then coat both and put them together upon a table. Press them thoroughly together, so as to force all the air out from between the surfaces, and bring them into perfect contact. Let them dry a few days.

**FRENCH POLISH.**—An excellent article may be made as follows: Take 1 ounce of shellac, ¼ oz. gum arabic, ¼ oz. gum copal; bruise them well, and sift through a piece of muslin; then put them with a pint of spirits of wine, into a closely corked vessel; place it in a very warm situation, and shake frequently every day till the gume are dissolved. Then strain through muslin, and keep well corked for use.

**VARNISH FOR SILVER.**—Elemi, 30 parts; white amber, 45 parts; sarcocool, 30 parts; spirits of turpentine, 375 parts. The varnish should be employed in a heated state, and the metal to which it is applied should be heated also. It answers equally well for plated goods.

## Life Thoughts.

OUT of debt—out of danger.

REVENGE a wrong, by forgiving it.

BETTER he alone than in had company. BETTER go around than fall into the ditch.

CONSTANT occupation prevents temptation.

A WISE man is never less alone than when he is alone.

To be angry is to avenge the faults of others upon themselves.

PRAYER is not overcoming God's reluctance, it is laying hold of his willingness.

HE that studies books alone will know how things ought to be; and he that studies men will know how things are.

TAKE care of your thoughts, for they lead to words and acts—just as brooks lead to rivers, and rivers to the ocean.

A PERSON who undertakes to raise himself by scandalizing others, might just as well sit down on a wheelbarrow and undertake to wheel himself.

THERE are some men so exquisitely selfish that they go through life not only without ever being loved, but without ever wishing to be.

PRIDE is the friend of the flatterer, the mother of envy, the nurse of fury, the sin of devils; and it hates superiors, scorns inferiors, and owns no equal.

LAZINESS grows on people; it begins in cobwebs, and ends in iron chains. The more business a man has to do, the more he is able to accomplish, for he learns to economize his time.

A CHRISTIAN should never plead spirituality for being a sloven. If he be a shoe cleaner, he should be the best in the parish.

A WORD of kindness is seldom spoken in vain. It is a seed which, even when dropped by chance, springs up a flower.

### Every-day Religion.

We must come back to our point which is, not to urge all of you to give yourselves up to a mission work, but to serve God more and more in connection with your daily calling. I have heard that a woman who has a mission makes a poor wife and a bad mother; this is very possible, and at the same time very lamentable; but the mission I would urge is not of this sort. Dirty rooms, slatternly gowns, and children with unwashed faces, are swift witnesses against the sincerity of those who keep others vineyard and neglect their own. I have no faith in that woman who talks of grace and glory abroad, and uses no soap and water at home. Let the buttons be on the shirts, let the children's socks be mended. Let the roast mutton be done to a turn, let the house be as neat as a new pin, and the home be as happy as home can be. Serve God by doing common actions in a heavenly spirit, and then, if your daily calling only leaves you cracks and crevices of time, fill these up with holy service.

**A GOOD MORAL CHARACTER.**—There is nothing which adds so much to the beauty and power of man as a good moral character. It is his wealth—his influence—his life. It dignifies him in every station, exalts him in every condition, and glorifies him in every period of his life. Such a character is more to be desired than anything else on earth. It makes a man free and independent. No servile tool, no cringing sycophant, no treacherous honor-seeker, ever bore such a character. The pure joys of truth and righteousness never spring in such persons. If young men but knew how much a good character would dignify and exalt them, how glorious it would make their prospects, even in this life, never should we find them yielding to the groveling and base-horn purposes of human nature which destroy body and soul.

**WASHINGTON.**—One of the most striking things ever said of him is, "that he changed mankind's ideas of political greatness." To commanding talent, and to success, the common elements of each greatness, he added disregard of self, a spotlessness of motive, a steady submission to every public and private duty, which threw far into the shade the whole crowd of vulgar great. The consequence is, that his fame is as enduring as his principles, as lasting as truth and virtue themselves.

## Business Cards.

**E. J. FRASER, M. D.,**  
SURGEON,

No. 102 Stookton Street, San Francisco, Cal.

**JOHN ROACH, Optician,**  
Has removed from 322 Montgomery street to  
540 Washington street,  
East of Montgomery.  
Surveying Instruments made, repaired and adjusted  
25-17-3m

**Farmers and Mechanics**  
**BANK OF SAVINGS,**  
No. 225 Sansome Street.

Interest paid on Deposits. Money Loaned on Real Estate.  
**H. DUTTON, President.**

**W. R. BARTLING.** **HENRY KIMBALL.**  
**BARTLING & KIMBALL,**  
**BOOK BINDERS,**  
Paper Rulers and Blank Book Manufacturers.  
505 Clay street, (southwest cor. Sansome),  
15-12-3m SAN FRANCISCO.

**SAN FRANCISCO**  
**CORDAGE COMPANY.**

M Manila Rope of all sizes. Also, Bals Rope and Whales  
Line constantly on hand. Mining Ropes of any size  
and length manufactured to order.

**TUBBS & CO., Agents,**  
611 and 613 Front Street.

**SAN FRANCISCO MILL.**  
**HOBBS, GILMORE & CO.,**  
Manufacturers of Boxes,  
Market Street, bet. Beale and Main.  
For sale—Mahogany, Spanish Cedar, and other Woods.

**JOSEPH GILLOTT'S**  
**STEEL PENS.**  
Sold by all Dealers throughout the World.

**J. F. PAGES,**  
**SEAL ENGRAVER,**  
**AND LETTER CUTTER,**  
Brass and Steel Stamps and Dies, 008 Sacramento street,  
San Francisco. Orders by express promptly attended to.

**L. SCHUMANN,**  
**PIONEER**  
**Meerscham Pipe Manufacturer,**

No. 341 KEARNY STREET,  
Between Bush and Pine streets, San Francisco.

The first and only Manufactory on the Pacific Coast.  
MEERSCHAUM MOUNTED WITH SILVER. Meerscham  
Pipes Boiled and Repaired. Amber Mouth-pieces Fitted.

**The Merchants' Exchange Bank**  
**OF SAN FRANCISCO.**

Capital, One Million Dollars.  
**LEVI STEVENS,**.....President.  
**E. N. VAN BRUNT,**.....Cashier.

**BANKING HOUSE,**  
**o. 415 CALIFORNIA STREET.**  
25-20-0y

**INTERNATIONAL HOTEL,**  
San Francisco, Cal.

This Favorite House is located on Jackson street, a  
few doors west from Montgomery; offers the greatest in-  
conveniences for Families. The International Coach will  
be at each Car Depot and Steamboat, plainly marked In-  
ternational Hotel, to convey passengers to the Hotel  
FREE, and to any part of the city at reasonable rates.  
**F. E. WEYGANT & H. C. PARTRIDGE,**  
24-22-3m Proprietors.

**MENZO SPRING,**  
Manufacturer of Dr. Douglas Bly's  
**Patent Artificial Limbs,**  
S. W. corner Second and Jessie Streets, San Francisco

All other kinds changed and repaired. The late im-  
provements on the Dr. Bly Limbs, especially his two  
best Legs (one with, the other without lateral motion  
at the ankle joint), make them far superior to all other  
Artificial Legs in use. (See illustration of Anatomical  
Leg, No. 3, present volume).  
For particulars call or send for circular. Circulars  
sent free. Address: **MENZO SPRING,**  
11-23-sa 101 Jessie street, San Francisco, Cal.

## STEPHENS &amp; CO.,

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with math-  
ematical accuracy.

The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.

In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and BEARER or INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.

"By the use of one of these, a huddler, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form."—*Scienti-  
fic American.*

Price by mail, prepaid, \$4. For agents' terms, address  
**STEPHENS & CO.,**  
Riverton, Conn.

## Miscellaneous.

**The Best Bedstead Fastening!**

**BARLOW'S PATENT, 1871.**

**Repair Your Bedsteads!**

By employing this new California invention, which is  
found to supercede all other Fastenings.

They are made of Wrought Iron, by machinery, and  
are easily applied quickly operated (as may be seen by  
the above illustration), and never break or wear out.  
Don't bother any longer with rickety bedsteads, but  
buy these fastenings and apply them yourself, or send  
to the inventor, who will repair any kind of bedsteads  
at reasonable rates. Examine this patent device, and,  
with the best workmen in the city, you will declare it  
to be the best and only perfect Fastening.

Orders received at my shop, corner of Sixteenth and  
Harrison streets, or at 320 Kearny street, Room 5.

## Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

## Altona Gravel Mining Company—Location

of works, Grass Valley, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of October, 1871, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office in San Francisco. Any stock upon which said assessment shall remain unpaid on the 4th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 26th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, DAVID WILDER, Secretary.  
Office, No. 24 Merchants' Exchange, California street, San Francisco, Cal. nov 4-5w

## Eagle Quicksilver Mining Company—Lo-

cation of works, Santa Barbara County, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of October, 1871, an assessment of Forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any share upon which said assessment shall remain unpaid on Thursday, January 4th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. nov 4-5w

## Kearsarge Mining Company—Location of

works, Kearsarge District, Inyo County, California.  
Notice is hereby given, that at a meeting of the Trustees of said company, held on the 21st day of October, A. D. 1871, an assessment of five (\$5) dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room No. 10, Express Building, northeast corner of California and Montgomery streets, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, the 18th day of November, A. D. 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 20th day of November, A. D. 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, J. L. KLINE, Secretary.  
Office, Room No. 10, Express Building, northeast corner of California and Montgomery streets, San Francisco, Cal. nov 4-5w

## Mina Rica Mining Company—Location

of works, Auburn District, Placer County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 15th day of November, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 2, 418 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, the 18th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, GEO. R. SPINNEY, Secretary.  
Office, Room No. 2, third floor, 418 California street, San Francisco, California. nov 5-5w

Room No. 2, Express Building, northeast corner California and Montgomery streets, San Francisco, Cal. nov 11-3w

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON  
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.  
The timber used is placed so directly in the line of strain, that less material is required to support the same load.  
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.  
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For All Public Bridges the Plan will always be open to competition.  
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.  
F. MALOON, Secretary.

W. H. GORRILL, President.

M. nov 18-3t WM. H. WATSON, Secretary.

## Stockholders' Meeting—The Annual

Meeting of the stockholders of the Golden Sun Gold Mining Company will be held at the office of the Company, No. 511 Washington street, on Monday, December 11, 1871, at 6:30 P. M. By order of the President, A. W. CHAPIN, Secretary.  
San Francisco, Nov. 22, 1871. nov 25-2w

The King of Mineral Springs is the German Seltzer, and Tarrant's Effervescent Seltzer Aperient is its duplicate. Letters attesting its wonderful Tonic and Anti-Bilious qualities swarm in from every source. The question has been settled whether effervescent waters may not be equal to those which burst sparkling from the earth itself. They can; and the Seltzer Aperient, when undoubtedly pure and genuine, proves the fact. Be cautious. Accept none other.

SOLD BY ALL DRUGGISTS.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the elevation of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 18v18-tf

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and he all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

nections of all sizes and patterns, furnished with dispatch

PRICES MODERATE. J. H. WEED V. KINGWELL

# CRAIG & BREVOORT'S Patent Condenser for Steam PUMPS, &c.

NO. 1.

The annexed engravings represent a Condenser intended to be attached to this ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is especially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam.

H. L. BREVOORT, Address 5v23ewly 128 Broadway, New York City

# THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

Platinum Scrap and Ore purchased.

# Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

**DEWEY & CO.,**  
American and Foreign Patent  
Agents, Publishers of  
the Scientific Press,  
San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

**Foreign Patents.**

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

**Home Counsel.**

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

**Confidential.**

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

**Engravings.**

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

**DEWEY & CO.**

**WIESTER & CO.,**  
No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.

**HUGHES' PATENT**

**REMOVABLE GLOBE LANTERN**

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the three-fold object of providing for the easy cleaning of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the ball to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

**The Best and Most Desirable in Use,**

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

Address 1811 Sidney street, East Birmingham, Pa.

## AVELING & PORTER'S IMPROVED ROAD ENGINE.

By Our New York Editor.

We present our readers to-day with a large illustration of Aveling & Porter's Improved English Road Locomotive. To

sults of a series of very exhaustive trials concluded during the month of September last, and undertaken by a committee of the Royal Engineers of the British Army; Col. Ray the chairman, Capt. Clayton the Secretary of the Committee, and many other distinguished members being present.

gine should not exceed that of the heaviest siege gun normal to battering trains—namely: 95 cwt. To meet this necessity, Messrs. Aveling & Porter have just constructed a "Steam Sapper," which is, we feel certain, the lightest engine of its power ever constructed, and with this en-

ing machines, etc. There are tenders for a supply of water and fuel, and the total weight of the engine with steam up, more than one cwt. of coal in the furnace and 50 gallons of water in the tank, was no more than 4 tons 15 cwt. and 3 qr., the driving wheels carry 3 tons, 14 cwt. 3 qr.

AVELING & PORTER'S IMPROVED ROAD ENGINE.

this road engine has just been awarded the first prize given by the Royal Agricultural Society of England, and among its competitors were the india-rubbertired Thompson Road Steamer, and eleven other engines.

Some particulars of the extraordinary performances of Messrs. Aveling & Porter's engine at the Wolverhampton trials in soft land have lately appeared in our columns, and we now add a more detailed description of the engine itself and its performances on hard roads, with the re-

Upwards of 600 of Messrs. Aveling's engines are in use in Europe, several of them being employed by the Royal Engineers' Corps for various duties connected with the removal of heavy pieces of ordnance and material of various descriptions, and they are answering the intended purpose excellently. One of the principal duties proposed for the very light class of engine with which the experiments were made, was the getting of siege guns and heavy artillery into position, and it was thought proper that the weight of the en-

gine these important trials were made

The boiler is of the locomotive type, as shown in our cut, and is lagged and felted, although the sketch, to show more clearly the construction of the boiler itself, omits this finishing process. It has 106 square feet of heating surface. The single cylinder is 7½ inches in diameter and 10-inch stroke, and the engine is so arranged that by simply removing a small pinion—the work of a minute—it is thrown out of gear and can be used for driving all kinds of machinery, including pumps, saws, thresh-

The driving wheels are of wrought iron and have wrought-iron spokes. The face of the wheel is ten inches wide, and the tire is fitted outside with wrought-iron spiral strips 2½ inches wide by 7 inches long and ½ inch thick; each is secured by rivets with the snaphead outside, and the whole wheel is extremely strong and light. The *Engineer*, in an excellently written article on these trials, says "the damage to the road was infinitesimal, a single horse going up the hill with half a ton of coal in

[Continued on page 339.]

# MECHANICAL PROGRESS.

## Engraving and Drilling by the Sand Blast.

The curious discovery of B. F. Tilghman, of Philadelphia, of the practicability of engraving on glass, and drilling the hardest substance by a simple blast of sand is exciting much interest both in this country and Europe. Very little force is required to produce the desired effect, to what one would naturally suppose would be required.

For merely abrading the surface of polished glass, or making "ground glass," a blast of air is used under a pressure of only four inches of water. The air is forced into a perpendicular tube about two feet below where the sand enters, and is thus carried with the blast against the sheets of glass, which are slowly moved across and about one inch below the lower end of the tube. About 15 seconds exposure of any given surface is sufficient to grind or thoroughly depolish the surface of ordinary glass. The sheets are carried along on endless belts, at the rate of 5 inches forward movement per minute.

By covering parts of the glass surface by a stencil or pattern of any tough or elastic material, such as paper, lace, caoutchouc, or oil-paint, designs of any kind may be engraved. There is a kind of colored glass made by having a thin stratum of colored glass melted or "flashed" on one side of an ordinary sheet of clear glass. If a stencil of sufficient toughness is placed on the colored side, and exposed to the sand-blast, the pattern can be cut through the colored stratum in from four to twenty minutes, according to its thickness.

The theoretical velocity of a current of air of the pressure of 4 in. of water, is about 135 feet per second; the actual velocity of the sand is much less. If a current of air of less velocity is used, say about one inch of water, very delicate materials, such as the green leaves of the fern, will resist a stream of fine sand long enough to allow their outlines to be engraved on glass. By graduating the time of exposure with sufficient nicety, so as to allow the thin parts of the leaves to be partly cut through by the sand while the thicker central ribs and their branches still resist, the effect of a shaded engraving may be produced.

For cutting stone, the inventor uses steam as the impelling jet; the higher the pressure, the greater is the velocity imparted to the sand, and the more rapid its cutting effect. In using steam of about 100 pounds pressure, the sand is introduced by a central iron tube, of about 3-16-in. bore, while the steam is made to issue from an annular passage surrounding the sand-tube. A certain amount of suction of air is thus produced, which draws the sand through the sand-tube into the steam jet, and both are then driven together through a tube about 6 in. long, in which the steam imparts its velocity to the sand, and finally strike on the stone, which is held about an inch distant from the end of the tube.

Under favorable conditions, using steam which he estimated as equal to about 1½ horse-power, at a pressure of about 125 pounds, the cutting effect per minute was about 1½ cubic inches of granite, or three cubic inches of marble, or 10 cubic inches of soft brown sandstone. With a steam jet of 300 pounds pressure, a hole 1½ in. in diameter was cut through a piece of corundum, 1½ in. thick, in 25 minutes. A hole 1 in. long and ¼ in. wide, was cut through a hard steel file a ¼ in. thick in 10 minutes with a jet of 100 pounds steam. The lightness of impact required to produce a drilling effect, even on a very hard surface was shown at the late exhibition of the American Institute in New York by a stream of small lead shot, driven by 50 pounds of steam, which wore a small hole in a piece of hard quartz. The shot was found to be only very slightly flattened by the blow, showing their velocity to have been moderate.

Among the curious examples of glass cut by this sand-blast was shown a piece of ordinary window glass, which, having been partially protected by a covering of wire gauze, had been cut entirely through, thus producing a glass sieve, with openings of about 1-12 of an inch, the intervening glass meshes being only 1-16 of an inch wide. This seems to have been produced more as a curiosity than for any practical purpose.

**FINISHING STEEL.**—Of all the methods or processes of working and finishing of steel, probably there is none extensively used about which there is so little known by mechanics in general as that of the "friction wheel," and this lack of knowledge has, no doubt kept its use confined within the bounds of almost a single class of work. It is generally known that the smooth edge of a soft steel or iron wheel, when run at a high speed, will cut tempered steel, soft steel, iron, and other substances very rapidly, but with it goes the belief that steel so cut is practically ruined for all useful purposes. This is true only to a certain extent, and is entirely avoidable by a proper speed of the friction-wheel and a skillful operator. A smooth steel wheel running with a periphery speed of from two to three miles per minute, will cut steel at a rapid rate, and without heating it to such an extent as to even change the color, the cutting wheel, too, retaining its form for a great length of time without being returned. Not only the spiral sides of augers and auger-bits are smoothed out and finished by friction-wheels, but the fine screw points of the same are wholly formed by the sharp edge of a soft steel plate run at the frightful speed of 14,000 revolutions a minute. The freedom from heating or burning the work, as well as the accuracy and beauty with which it is done, is unquestionably in a great measure due to the skill of the operator; still this skill may be matched by the skill of the inventors, and the friction wheel applied to hundreds of purposes yet unthought of.—*American Artizan.*

**A NEW BRONZE.**—We learn from a recent copy of the *Polytechnisches Journal*, that some investigators have succeeded in producing a new alloy which possesses peculiar advantages over others, for a number of processes in the arts. The peculiarity of the new compounds consists in the fact that it contains phosphorus as an ingredient. The authors have not divulged the details of the plan by which they succeeded in introducing this substance into combination. It is used with copper, or with copper and tin, either with or without the addition of zinc. The alloy produced is said to be peculiarly adapted for the construction of certain portions of machinery, as also for gun-barrels.

It seems, from an editorial note from Dr. Dingler, that the attempt to introduce phosphorus into the composition of several common alloys had been repeatedly made, but without success. The well-marked influence which its presence, in even trifling quantity, exerts upon the physical properties of irons, would seem to be the ground upon which the repeated efforts to utilize its presumable influence on other metals, is based; and there can be very little doubt but that the subject is worthy of the most careful attention of workers in metal.

**DIES FOR THREAD-CUTTING.**—The foreman of a large establishment in Philadelphia for making wrought-iron gas-pipe, says that the dies for threading the ends of the pipe should be made with more material than is absolutely necessary on the score of strength, in order that the surplus metal may aid in conducting away the heat. He says that in cutting the maximum number of ends without sharpening the dies, with a solid die made of the least possible amount of metal consistent with strength, as compared with one made of, say, four times the amount of metal, the large die will cut four or five thousand ends, while the small one will be dull after cutting fifteen hundred. The cutting edges are the same in both cases.—*Journal Franklin Institute.*

**THE NEW YORK DOCKS.**—It is stated that the work upon the rebuilding of the docks of that city is in progress. The plan, if carried out in accordance with announcement, will secure to the city a wharf-line of thirty-seven miles, and a pier area of more than five million square feet. It is designed to build a river-wall of solid masonry along the North and East Rivers, from which, at regular distances, piers, none less than sixty and many one hundred feet in width, are to be built at right angles.

**NEW MODE OF ORNAMENTING METAL.**—A new process of ornamenting metallic surfaces by electro-depositions from solutions consists in producing a deposit or plating of metal upon the surface of another metal, by painting the latter with a salt or solution of a salt of the metal to be deposited by means of a pencil, which is in metallic connection with a galvanic battery, the other pole of which is in metallic connection with the metal to be operated upon.

# SCIENTIFIC PROGRESS.

## Artificial Formation of Organic Bodies.

The first instance of the artificial formation of an organic substance from inorganic matter, was announced by Wohler, in 1828. He produced urea from cyanite of ammonia. By many this discovery was hailed as a consummation of the dreams of the alchemists, and wonderful things were expected. And, indeed, wonderful discoveries have since been made in this direction; but still the researches are comparatively slow of results. The second discovery of the kind was made in 1831, by Pelouze, who produced *formic acid* artificially.

From that time 15 years elapsed before another similar announcement was made, when in 1846, Melsens produced marsh gas. The next year acetic acid was discovered by three different persons—Dumas, Malaguti and LeBlanc. It was ten years till Bertagnini and Harnitzky, each separately produced *cinemic acid*.

From this time on, during the next decade, every year witnessed the discovery of some one or more artificial productions of organic compounds from inorganic substances—the order of discovery and names of which were as follows:—Glycols, malic and tartaric acid, sugar, alcohol, amylenes, amine, lactic acid, diatomic, leucic, melonic, carballylic acids, isomer of butyric alcohol, a fatty and aromatic series of acids, toluene, acetonitic, butyric, caporic, tartaric, toluic, oxalic, and malonic acids.

This brings us down to 1867, when Wurtz announced the discovery of *reine*, since which we have had picolin, the oil of rue, and alizarine. Several other discoveries have been made, but the facts with regard thereto are either uncertain or unattainable by the *American Chemist*, from which we condense the above.

With our improved methods of research, it would be highly censurable to attempt, adds the *Chemist*, to fix a limit to the onward progress of the synthetical formation of organic compounds; indeed, we believe that the chemist will cross over and possess all the hidden fields of organic chemistry.

**A NEW ZINC PAINT.**—A new zinc paint of remarkable stability, and particularly adapted to coating metals, is prepared in Belgium, by mixing zinc white and soluble soda or potash glass. It adheres better to metallic zinc than any other preparation, and diminishes the absorption of heat so materially that attic rooms under a roof painted with it show ten degrees less temperature than the unprotected rooms. It hearse all changes of temperature, cold, sun and rain, and what will give it great value is the fact that it will render fabrics, paper, wood and all tissues, entirely incombustible. Wood painted with it will resist flame for a long time, and, if the pores could be filled with it, there would be no danger of its bursting into flame. The same materials mixed in different proportions could be cast into molds and used very much as plaster now is. If the zinc were not too expensive, an artificial stone could be made by combining the silicate of soda with the oxide.

**SUBMARINE ILLUMINATION.**—Prof. Pepper has recently made some highly interesting experiments at the London (Eng.) Polytechnic Institution in submarine illumination by means of the electric light as applied in a new and ingenious apparatus, the invention of Messrs. Heinke and Davis. In this apparatus the jet is contained in an air-tight lantern, and produces a perfect and well-radiated light under water. The importance of this invention as connected with all purposes to which the diving bell is applied, can hardly be over-rated, and the professor had no hesitation in expressing an opinion favorable to its efficiency.

**COATING SHEET-IRON WITH ZINC.**—One of the most recently proposed methods of zincing iron is by passing the iron sheets through a flux of sal-ammoniac, then through molten zinc, again through the same flux, then through smoothing-rolls, and finally impinging thereon a current of cold air as it rises from the bath.

**NON-HOMOGENEITY OF SILVER AND COPPER ALLOY.**—W. C. Roberts has shown apparently to the satisfaction of the British Mint Authorities, that the homogeneous nature of an alloy of silver and copper is destroyed by the cooling of the molten mass, the silver being concentrated in the centre.

## New Glass Cement.

Professor Böttger prepares cement of divers colors and great hardness by mixing various bases with soluble glass. Soluble soda glass, thoroughly stirred and mixed with fine chalk, and the coloring matter well incorporated, sets in the course of six or eight hours as a hard cement; it is capable of a great variety of uses. Well-sifted sulphide of antimony gives a black mass, which, after solidifying, can be polished with agate, and then possesses a fine metallic luster. Fine iron dust gives a gray-black cement; zinc dust makes a grey mass, exceedingly hard, which, on being polished, has a brilliant metallic luster, so that broken or defective zinc castings can be mended and restored. Carbonate of copper gives a bright-green cement; sesquioxide of chromium gives a dark green; Thenard's blue, a blue; litharge, a yellow; cinnabar, a bright-red; carmine, a violet-red cement. The soluble glass with fine chalk alone gives a white cement of great beauty and hardness. Sulphide of antimony and iron dust, in equal proportions, stirred in with soluble glass, afford an exceedingly firm black cement; zinc dust and iron in equal proportions yield a hard, dark-gray cement; all adhere firmly to metal, stone, and wood. As soluble glass can be kept in liquid form and the chalk and coloring matters are cheap, the cements can be readily prepared when wanted, and the material kept in stock ready for use, at little expense. Soluble glass is fast becoming a most important article of chemical production.

**SUBSTITUTE FOR GUN POWDER IN COAL MINES.**—Mr. S. P. Bidder, of England, has recently introduced an ingenious device, which, aside from its practical utility, possesses an important value in the interests of humanity, in the fact that by its use, gunpowder can be dispensed with in coal mining, and perhaps in some other underground workings where the material to be operated on may not be too unyielding.

The device consists of two separate parts, a drill for making a preparatory channel into the seam and a long arm which is carried down this channel.

The same individual has also produced a new form of miner's safety lamp, the novelty being in a lock with which the miner cannot tamper. It is fastened by a bar of iron which is nowhere accessible from the outside, but which is drawn down by the action of a powerful electro-magnet, to be kept in the colliery office for the purpose, and on which the lamp must be placed in order to open it.

**AERONAUTIC COMPASS.**—The efforts to keep up communications between Paris and the outer world during the recent siege led to the invention of several ingenious contrivances connected with ballooning, not the less interesting being Mr. Janssen's aeronautic compass, the object of which is to enable the aeronaut to ascertain at any moment both the speed and direction of the balloon. It consists of a graduated glass disc with a hole in the centre; at a certain distance above the central hole is fixed a small eye-hole, and on one of the points of the circumference of the disc is fixed a small compass. The apparatus is suspended perpendicularly outside the car. It may be mentioned in this connection that, in a communication to the Academy of Sciences, M. de Fonville expressed the opinion, as the result of his experience, that no attempts at the direction of balloons will succeed except above the clouds.

**THE ABSORBENT POWER OF RED PHOSPHORUS.**—An interesting paper on the "Absorbent Power of Red Phosphorus" is contributed to the May number of the *Gazette Chimica Italiana* by Fausto Sestini, from the Laboratory of the Royal Technical Institute of Udine. The author finds that red phosphorus absorbs many substances without combining with them after the manner of porous charcoal. Thus it may be made to take up 3,369 per cent. of iodine, a considerable quantity of sulphur, roaniline, etc. This power of "chemical adhesion" may be easily and strikingly shown by shaking powdered red phosphorus in a test tube containing a colored solution of iodine in bisulphide of carbon. When a sufficient quantity of phosphorus is used the whole of the iodine is taken up and the solvent rendered colorless. Rosaline is similarly removed from an ethereal solution, and a portion of it may be again recovered unaltered from the phosphorus by washing with alcohol.

## CORRESPONDENCE.

### San Diego Mines.

EDITORS PRESS:—Since my last letter, no interesting changes in business or mines have taken place in Julian District, until very recently.

#### The Owens Company

have sunk their shaft to the depth of 180 feet, at the bottom of which they have a well defined ledge five feet in width. They started a drift south from the shaft, and in going a few feet the ledge opened out to seven feet in width in decomposed ore, and now two men can take out rock faster than it can be hoisted with the whim. The ore is of good quality, the entire ledge prospecting well, and, from the prospects, will no doubt pay well. This is the most promising development yet made in the district, as no other ledge has been prospected so deep, and proves that our mines are permanent ledges, growing larger and better with the depth. This mine is rendered more valuable, because there is no necessity for blasting.

#### The California Company

have timbered their shaft in splendid style, and, although the ledge was reduced to a seam of quartz that did not show the color of gold for many feet, confined by hard iron rock, at the depth of 90 feet the formation became softer, and the ledge widened out to two feet, containing some free gold, and prospecting well. They have just got their works enclosed, so that they can keep the work running all winter.

#### Mines and Mills.

The Hayden Company are working slowly but surely; their rock always pays well, and when they have a crushing, they have the satisfaction of knowing that they have the money to divide only between two owners. The Helvetia moves along in her quiet way, taking out and working good pay regularly. Mr. Woodward's new discovery, that I spoke of in my last, bids fair to become an important mine; he is now having some of the rock crushed as it comes from the ledge, in Gunn & Reynolds' mill, and it shows well on the plates, and judges say it will pay well. De Fries' and Gunn & Reynolds' mills are kept constantly running in the daytime, water being too scarce to run night and day. We had a severe storm on last Saturday night, and expect plenty of water soon.

#### San Felipe Canon, Banner District.

Things have been very quiet for a few weeks. In consequence of the abundance of water in the Redmann mine, Mr. Whitney was obliged to shut down the work and send to San Francisco for pump and engine, which have arrived, and will soon start up; the mine will afford rock enough to keep the McMechan mill running. The Antelope mill has also been idle a short time, awaiting the return from San Francisco of J. M. Tiernan, with additional machinery. This will soon be started for regular running, with new machinery. The Antelope, Chapparel, Kentucky, Madden and Ready Relief are all at work, and looking well. The Big Blue is having fifty tons of ore crushed at De Fries' mill, which is variously estimated as returning from \$50 to \$80 per ton.

#### The Golden Chariot,

which paid \$182 per ton, first crushing, and \$156, last crushing, is now looking better than ever, with a ledge nine feet wide; the boys say they are sorry that they bonded their mine to Mr. Wilson for \$65,000, as they have more than that in sight. There is much more to say about the developments now being made here, but knowing that your columns are always crowded, I will defer further notice until next week.

L. B. H.

Julian City, Nov. 15th.

### The Northern Quicksilver Mines.

EDS. PRESS:—Your correspondent recently made a flying trip to Lake county, with the intention of visiting the quicksilver mines, Clear Lake, the Sulphur Banks, Borax Lake, etc., and other points of interest in that interesting section of the State. Our party was fully equipped with arms, ammunition, hooks, lines, hammers

and other paraphernalia for the capture of game, fish, minerals, shells, etc.

The first point of interest we visited was the

#### Oakville Quicksilver Mine.

This mine is situated near Rutherford's Station on the Napa Valley R. R., 15 miles from Napa, and 16 miles from Calistoga, but a few hundred yards from the edge of the valley, which at this point is well defined. From the entrance of the mine one can have a fine view of the surrounding country, the valley with its fine growth of magnificent oaks, the mountains on the opposite side covered with chamisal, and further north Mt. St. Helena, and the pine-covered ridges of Lake county. The mine was first located in 1864, afterward abandoned, again taken up by Mr. W. T. Lockhart; it is now owned by an incorporated company, O. P. Sutton, of San Francisco, President; W. T. Lockhart is General Superintendent, and by his kindness our party was invited to examine the mine and works. They were just heating up their

#### New Furnaces,

(Riotte & Lockhardt's), which promises to make a great saving in the cost of reduction; this furnace is fed continuously, and has a capacity to reduce 12 to 16 tons of ore per day; with the old furnace 140 tons of ore were reduced, which produced from 50 to 110 pounds of mercury to the ton of ore, or an average of about 75 lbs. It is expected that the same quality of ore reduced by the new furnace will produce an average of about 100 pounds per ton, besides making a considerable saving in fuel.

Some \$15,000 have been expended by the present owners in opening up the mine and building the works, which also include the cost of taking out about 800 tons of ore; they estimate 3,000 tons of ore exposed. Captain Williams, the Mining Superintendent, under whose guidance we examined the underground works, is quite enthusiastic as to the future of the mine, and he seems to understand his business thoroughly, which cannot be said of many of the mining superintendents in this State, who show a remarkable ignorance of scientific mining and mineralogy, but seem to "go it blind," continually expecting like Mr. Micawber that something will "turn up" in their favor.

After leaving Calistoga, one of our party either fearing that in our peregrinations we might make the acquaintance of a bear, or, as he claimed, that a storm was about to set in, insisted upon an immediate return. We arrived at Lower Lake in the evening after experiencing a very unpleasant day, and started next morning before breakfast, without seeing the "Lake," the Sulphur Banks, or any other natural curiosity which we had started out to see, and arrived at Knoxville the same day; saw Mr. Livermore, the Superintendent of the

#### Redington Mins,

who promised to show us around next morning; started early next morning for the mine, but as the individual of our party who had no taste for curiosities or science, insisted on returning and the wagon was about to start, I had to leave without seeing the Superintendent, or taking any items, except that the mine has about 100 men employed and that the buildings and works are the finest I have seen at any mine in the State. I fully intend to make another trip and examine the Redington and other mines in Lake and Napa counties to my own satisfaction.

ANON.

SAOKING EVERGREENS.—We learn from Mr. Kelsey, of the Oakland Nursery, that people complain a great deal that the young evergreen trees are not doing well. Mr. Kelsey has planted many thousands, tying up the roots in sacks and setting them in the ground, sacks and all, merely cutting the ropes. The sacks will decay in 14 days, and the trees have never failed to grow.

ACCORDING to recent and valuable estimates, our globe has a population of 1,350,200,000. Of this, America has 72,800,000; Europe, 287,000,000; Asia, 498,600,000; Africa, 188,000,000; Australia and Polynesia, 3,000,000. Language spoken, 3,600; religious sects, 1,000.

[Continued from page 337.]

a cart would do more." In a description of the little engine going up a hill having a maximum grade of 1 inch in 11, the *Engineer* says: "The net weight of the train, according to the Rochester weigh bridge, was 15 tons, 6 cwt., 2 qr., exclusive of the weight of engine. The gross load, including the engine, taken up Star Hill, was 19 tons, 19 cwt., 2 qr. With this load the engine just got up without any slipping of consequence, but it is probable that at the steepest incline she was loaded to the last ounce."

The chances are, we think, that this performance is unparalleled, and when we consider that the total weight of this little engine did not exceed 4 tons, 15 cwt., and that the weight on its drivers was but 3 tons, 14 cwt., it certainly is an extraordinary feat, and one which may well stagger the advocates of rubber tires and their extravagant statements as to the increased traction power to be gained by their use. The handiness with which these engines are moved about and turned in their own length, is not the least remarkable feature of their simplicity, and the fact that the whole machine is managed by one man, is a point gained in economy that lessens very materially the daily working expenses.

An engine such as we have been describing costs in New York \$3,000 in gold, and the expense of working it per day, including coal, man's wages, oil, etc., not more than \$6½. It can be safely depended on to haul 10 tons up inclines such as Star Hill, and will do this at the rate of three miles an hour. It will not be difficult to see the vast amount of saving that may be effected in the carriage of heavy material as compared with the employment of horses or mules.

From *Engineering* of Sept. 22d, we append some extracts of an article on the late performances of one of these small engines of Messrs. Aveling & Porter's manufacture, and side by side are placed results of trials of the Sutherland Road Steamer with Thompson's india-rubber tires and those of a 6-horse rigid wheel engine such as we have been describing:

On Tuesday last an interesting trial was made, on the road between Rochester and Chatham, of one of the light class of 6-horse traction engines constructed by Messrs. Aveling & Porter, of the former place. The principal gradients to be traversed had been accurately ascertained previous to the trial, and the latter was conducted under the immediate superintendence of Col. Ray, Royal Engineers, Capt. Clayton, R. E., the Secretary and other officers of the Committee.

The engine with which the experiments were made was similar to that which did so good a duty during the recent trials of the Royal Agricultural Society at Barnhurst. It had a single cylinder 7½ in. in diameter, and 10 in. stroke, and driving wheels 5 ft. in diameter, while the gearing was in the ratio of 17 to 1. The boiler was of the usual locomotive type, with 25 square feet of fire-box surface, and 84 square feet of tube surface, or 109 square feet of heating surface in all, while the fire-grate area was 4.15 square feet. The weight of the engine in working order was 5 tons 4 cwt. 1 qr., of which weight probably about 4½ tons was, when the engine was pulling, thrown upon the driving wheels. The latter, we should state, were of wrought iron, the tires having wrought-iron cross strips riveted on them diagonally.

The load consisted of four loaded wagons, weighing respectively 4 tons, 4 tons 10 cwt. 2 qr. 14 lb., 4 tons 8 cwt., and 2 tons 8 cwt., making together 15 tons 6 cwt. 2 qr. 14 lb., or, including the engine, 20 tons 10 cwt. 3 qr. 14 lb. This load was taken up the Star Hill, Rochester, in six minutes, the engine doing its work well, with scarcely any slipping, and the pressure of steam being 110 lb. From the section which we annex it will be seen that the total length of the Star Hill is 1,137 ft., in which distance it rises 63 ft., giving an average gradient of almost exactly 1 in 18. The steepest part, however, is 1 in 11, and by far the greater portion of the length is on gradients of 1 in 14, and 1 in 16. The length of 1,137 ft. accomplished in six minutes, gave a speed of 2.15 miles per hour.

[We will continue this article next week, with table showing the comparative performances of the two engines in question.]

### Keeping Fruit.

The question as to the best method of keeping fruit in this country, is a very important one, and is inducing many important experiments.

L. A. Gould, of Santa Clara, is perhaps conducting one of the most important and expensive experiments in the State. He has built a brick store-house, forty feet by eighty, in Truckee. Through the center of this building he has left a passage-way eight feet wide, and has filled all the rest of the space with boxes of apples. Strips of lath are laid on each tier of boxes, so as to give space for the circulation of air, and to hold them up as a body. The building is supplied with plenty of ventilation at the roof, but from what we learn, we fear there are not sufficient openings near the bottom to give proper circulation. Fruit will undoubtedly keep much better in a low temperature, and Mr. Gould is endeavoring to take advantage of this fact. If he makes a few mistakes this time, he will be able to avoid them next year. The experiment is an important one, and we shall watch it with interest.

Capt. Anderson, of Shady Run, five miles above Alta, between 600 and 1,000 feet below the highest altitude of the Central Railroad, keeps his fruit in a shallow bin under his house. His house stands about four feet above the ground, and the bin sets on the natural surface of the soil. The space under the house is well hoarded up, so as to keep the apples from freezing. He keeps his apples here, in good condition, till April and May.

We know of others who pack their fruit in clean sand, in boxes—let the boxes stand out in the weather; only taking the precaution to have the boxes so placed that all the water that falls on them will pass through the sand and drain out. Fruit keeps very fresh and juicy in this way, retaining all its natural flavor until late in the season. Our own experience is, that a cellar under or below the surface of the ground, is a poor place to keep fruit; the air seems to be too close and damp, and induces decay.

We have found that apples, placed in open boxes and left under the tree—screened from the sun, but subject to all the changes of the weather—keeps much better, in our valleys, than under a dry shed, or in a cellar. We have also observed that fruit grown in the mountains keeps much better than that grown in the valleys; and we think that eventually the country will depend for its winter fruit mainly on the mountains, and that, that grown in the valleys will be chiefly dried or preserved.

We would be glad if fruit-growers would give us facts within their knowledge, in reference to this interesting subject. We will publish them for general information.

### Items in Brief.

THE tobacco factories of New York and Brooklyn employ 20,000 children.

A SILVER ledge has been discovered near Astoria. Thirteen claims have been located. The excitement in the neighborhood is high.

HAND-made lace of all the industries of France has suffered least by the war, being chiefly carried on by women.

THE hair on a camel weighs about ten pounds, and sells for more than £20, which shows that it was not only in the days of Mahomet that the animal bore a great prophet.

A PROJECT for uniting the Black and Caspian Seas by a canal according to the plan of Captain Blum, is engaging the attention of the Russian Government. The cost is estimated at about \$50,000,000.

THE Old Colony Railroad in Massachusetts in 1868 gave a free pass to all who would build houses in the village of Wollaston Heights. The result has been that the paying passengers from that station to and from Boston are more than ten times as many now as three years ago.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### AMADOR COUNTY.

**KENNEDY MINE.**—Jackson *Ledger*, Nov. 25th: The rock being taken from the lower levels is looking remarkably well.

### CALAVERAS COUNTY.

**RICH SPECIMEN.**—Calaveras *Chronicle*, Nov. 25th: We have been shown an exceedingly rich specimen of quartz taken from the Gwin mine. The piece of ore is a curious intermixture of slate, quartz, sulphurets and gold—the latter predominating; a stratum of such rock is developed as the levels are run.

**WOLVERINE MINE.**—The work of prospecting the lead has proved the existence of 3 ariferous chimneys known as north, middle, and south chimneys. The latter has been "stoped" out 126 feet, the quartz extracted averaged over \$25 per ton. The new engine shaft passed through a part of the middle chimney 121 feet from the surface. At that point some excellent quartz was taken out containing gold in visible quantities with galena and iron sulphurets. The north chimney was intersected by the shaft at 182 ft. To the depth now reached—220—the quartz composing the chimney has rapidly improved. The fissure is 2½ ft. wide between walls and is gradually widening as the shaft increases in depth. The rich stratum recently struck is about 6 inches wide, and consists of a beautiful dark blue quartz, rich in gold, and the sulphurets of iron and galena. The best ore taken from the rich stratum recently discovered will pay as high as \$150 per ton, while none of it will fall under \$20 per ton.

### EL DORADO COUNTY.

**PLACERVILLE REPUBLICAN.**, Nov. 23d: All the mines in this vicinity are now looking up.

We hear two new quartz mills talked of to be put up in this vicinity the present season.

The Robertson gravel mine is paying largely. Some of the gravel taken out pays as high as \$600 to the car load.

The new quartz mill being erected at El Dorado for Davidson & Theiss, is nearly completed.

### INYO COUNTY.

**STRIKE.**—Inyo *Independent*, Nov. 18th: A. Wingard, Supt. of the Silver Sprout mines has shown us a quantity of ore which is pronounced to be the finest ever produced in this county. It appears to be a singular combination of some of the richest characters of silver ore, chloride and black sulphurets, while particles of the white, native silver are seen, with now and then good "colors" of gold. The shaft is 56 ft. in depth, the ledge 7 and the ore 5 ft. in thickness. Its average value will be \$1,000 per ton, and probably more. The walls are nearly perpendicular, smooth and perfect and the 2 foot "gouge" is being rapidly crowded out by the "pay," which grows richer from top to bottom.

**EAST OF THE INYO RANGE.**—D. E. Hunter gives us the following: At Gold Mt. dist. north of Death Valley, Shaw & Co. were working ore from the "State Line" lode by means of a horse power arastra and making about \$10 per day. This is said to be a large and extensive ledge of gold bearing quartz. A lot of the ore worked at Belmont yielded \$170 per ton. Several men were running rockers, and making fair wages, on some placer diggings about 8 miles southeast of Palmetto.

**CERRO GORDO.**—Enterprise, Nov. 22d: The mines in Cerro Gordo are all doing well. They improve as depth upon the leads is attained, and the smelting furnaces are turning out cords of bricks of silver and lead. The ores of the dist. are almost without exception argentiferous galena.

### LASSEN COUNTY.

**RICH ROCK.**—Plumas *National*, Nov. 18th: The Providence, Co. of Hayden Hill have lately put up a small mill on their mine and the result of the crushing indicates that they have one of the richest mines in the northern part of the State. J. D. Goodwin informs us that the Co. cleaned up, for a run of 11 days with 2 stamps, 3,500 ozs., of amalgam worth about \$4 per ounce.

### LOS ANGELES COUNTY.

**SAN GABRIEL RIVER MINES.**—Los Angeles *News*, Nov. 18th: The Roberts Co. has rigged up the hydraulic machinery, lately received from S. F., and will commence piling in a few days. The Ferguson Co. has been hydraulicizing during

the last few days, and took out \$500 from a small patch of ground. Other Co.'s are at work tunneling and packing the dirt to the river for washing, and are doing well.

### NEVADA COUNTY.

**UNION GRAVEL.**—Grass Valley *Republican*, Nov. 18th: This Co., at Columbia Hill, are making extensive preparations for hydraulic mining. Heretofore they have used about 400 inches of water day and night. As night work is not as profitable as day work, the Co. concluded to construct a large reservoir and use 1,000 inches 10 hours daily. This reservoir will be completed in about 3 weeks at a cost of between \$3,000 and \$4,000. Sixty men are employed in its construction. The Co. have run a hedrock tunnel 1,050 ft., and have 600 ft. yet to finish. To expedite the completion of the tunnel, the Co. are making arrangements to put in a diamond drill.

**HUESTON HILL.**—A crushing of 15 loads of rock from this old mine has paid \$1,893—or \$126 per ton.

**PERRIN MINE.**—The result of a crushing of 34 loads of rock from the Perrin mine was \$1,756, or \$57.64 per load.

**BANNER MINE.**—The Banner mill and mine employs 60 men. The lower level is 700 ft. down on the incline. Some excellent sulphurets ore is being taken out which prospects over \$100 a ton. The mill is running 20 stamps.

**MANHATTAN MINE.**—This mine, between the Pittsburgh and the Banner, near Nevada City, is being thoroughly prospected. The prospecting shaft is down 260 ft. on the ledge. From the bottom of the shaft drifts have been run 120 ft. The ledge is about 15 inches wide, and the ore prospects from \$20 to \$40 a ton.

**RISEING STAR LEDGE.**—The owners of the Rising Star (formerly known as the Wyoming) ledge, on Wood's Ravine, 2 miles west of Nevada city, are now taking out some excellent ore. The ledge is from 2 to 4 ft. wide, is worked without machinery, and is about 200 ft. above Deer creek. The ore from this ledge has never yielded less than \$20 a ton, while the highest yield was \$57.

**NEVADA QUARTZ MINE.**—Nevada *Transcript*, Nov. 24th: The Nevada Quartz M. Co., are "pushing things" in their new works. They are sinking the new incline on a large ledge and are taking out first rate rock.

**MINING LOCATIONS.**—J. F. Schulthess and others have located 3 ledges on Independence Hill, Grass Valley township, and consolidated them under the name of the Independent M. Co.

E. Alliston & Co. have located the waters of Shady creek, below Simpson's dam, in Bridgeport township.

F. Morlet & Co. have located 1,000 ft. on a quartz ledge situated on Little Rock creek, in Nevada township.

Monitor M. Co. has located 1,200 ft. on a quartz ledge, on the west side of Last Chance ravine, in Willow Valley.

**MINING IN NEVADA TOWNSHIP.** presents at this time a most encouraging prospect. The Banner, Pittsburgh, Pennsylvania, Manhattan, Nevada, and several others in the vicinity of Nevada City are being worked. The Providence is soon to be fitted up, and the Gold Tunnel is being worked. Besides those named there are a number of others which are being prospected or prepared for work.

In gravel mining there are also a number of claims which will be worked. The Co.'s on Oustomah Hill and at Cement Hill are getting ready for work, while the old Manzanita is being steadily worked. Recently some new locations have been made. At Blue Tent several large claims are fitting up and will be ready for work by the time water arrives.

**MINING WORK.**—Grass Valley *Union*, Nov. 24th: The Seven Thirty Co. is putting new timbers into the shaft, and will shortly commence to sink deeper on the ledge. Of late the mine has been looking well.

Daisy Hill Co. is timbering the mine in a substantial manner, preparatory to making extensive developments. The steam machinery for hoisting and pumping will soon be at work.

### PLACER COUNTY.

**SHANNON CLAIM.**—Placer *Herald*, Nov. 25th: The claim shows plenty of free gold where opened.

### PLUMAS COUNTY.

**PAYING.**—Quincy *National*, Nov. 18th: Betterton, who owns the new discovery at Mohawk Valley, has got his arastra running, and from 2 tons of rock crushed, cleaned up \$75.

### SAN DIEGO COUNTY.

**BULLION.**—San Diego *Union*, Nov. 16th: The shipment yesterday, amounted to

\$1,300, principally from the Julian and Banner mines.

### SAN LUIS OBISPO COUNTY.

**THE CAMBRIA MINES.**—San Luis Obispo *Tribune*, Nov. 25th: At the Pine Buttes, miners are flocking in from Cambria and other places. A large number of claims have been staked off, and 3 Cos. are working. In the claim where the vein was originally struck a tunnel has been run in 65 ft. and a well defused vein of quick-silver-bearing ore opened.

### SIERRA COUNTY.

**GOOD CLEAN UP.**—Mountain *Messenger*, Nov. 18th: The new 20-stamp mill, at the Keystone, was cleaned up on Wednesday, after a run of 30 days, and the result was over \$18,000 gold, over 900 fine.

**ALLEGHANY.**—Fields, who works near the bridge, on Kanaka, recently found a nugget valued at \$1,600; also several smaller ones.

### SISKIYOU COUNTY.

Grass Valley *Union*, Nov. 18th: Frank Morse of this place returned yesterday from Siskiyou county. He informs us that mining in that region is in its infancy, so far as quartz is concerned, and that there are more inducements there for quartz mining than in any part of California he has visited. The Black Bear mine, has a ledge 11 ft. thick, which pays, by mill process, \$80 to the ton. Other discoveries have lately been made which will call great attention to Siskiyou county in particular and to the mining interests in general.

The Lash mill and mine in Humboldt Dist. continue in full operation. The ledge in the 5th level is 7 ft. wide, showing a fine body of ore. A large quantity of rich sulphurets are piled away for future reduction.

### TULARE COUNTY.

**COAL.**—Visalia *Delta*, Nov. 23d: Several parties have discovered what they deem to be good coal veins, in the mountains to the Northeast of here.

**DISCOVERY.**—Visalia *Times*, Nov. 18th: Charles Converse, some time during the latter part of last month made the discovery of a quartz ledge, which bids fair to prove a rich one. The gold in the rock is plainly visible to the naked eye. The ledge is about 3½ ft. wide and bears every indication of proving valuable. It is in the mountains about 50 miles northeast of Visalia.

## Nevada.

**FISH CREEK DIST.**—Eureka *Sentinel*, Nov. 19th: We have met many owners of claims from this dist. within the last few days, and they seem unanimous in asserting that they have a big thing. Some specimens shown us were rich in silver and carried sufficient percentage in lead, to make good smelting material.

**PINTO.**—Cor. same: The near approach of the completion of the Pinto Mill and Furnace, 5 miles distant, has given an impetus to everything, and never since its discovery has the camp been so flourishing as at present.

The principal mines of the dist. are owned by the Pinto S. M. Co., the Maryland, Michigan, Mountain Chief, and Uncle Sam. Since their purchase, work has been prosecuted vigorously upon the whole of them, with a force of 40 men. There are hundreds of tons of ore lying on the dumps, some of it assaying into the thousands, and all of it fine milling rock.

Of these mines, the Maryland is perhaps the most important. The main shaft is down about 200 ft., on a slight incline, running in fine ore the entire distance. Fifty ft. from the surface is a drift, running in ore from the north side of the incline, and raising to the surface about 50 ft. from the main shaft. This drift connects, through a winze, with another drift at the depth of 100 ft. This, with still another at the depth of 175 ft. below the surface, in which a magnificent body of high grade ore has lately been uncovered. They have followed it down about 15 ft. and the quantity is steadily increasing. The main shaft is being sunk rapidly in order to connect with a tunnel which is being run about 125 ft. below the bottom of the shaft. This is already in 450 ft. leaving but 100 ft. to go.

The Michigan is down 110 ft. with an unbroken ledge from top to bottom. A tunnel run on the level strikes the shaft 30 ft. from the surface, and 25 ft. below this, is a drift running under the tunnel 50 ft. Twenty-five ft. further down is another drift running on the ledge 50 ft. each way from the shaft, and at the bottom another running 70 ft. on the level which has not a break in it, and is in splendid working order, it being only necessary to stoop out from one drift to another, to take out immense quantities of ore.

The Mountain Chief has been sunk 112

ft. A tunnel 130 ft. in length connects with the shaft 50 ft. from the surface. Thirty-five ft. below the tunnel is a drift running from the east side of the shaft, and following the level for 90 ft. At the bottom is a drift east and west 100 ft., in which men are stooping out and breaking down large quantities of high grade rock. The ledge is traceable for nearly a mile on the surface.

In the Uncle Sam they are working 4 men, who are taking out nothing but ore, which assays from \$175 to \$300. A tunnel has been run into the hill 50 ft., at the entrance of which a shaft was sunk 30 ft., and from this point a "raise" was made following the ore, and breaking in the tunnel some 30 ft. from its mouth. The men are working in this tunnel, breaking ore from both sides, and from all indications there is a large body of it.

The Silver Stone, the property of Capt. Adams & Co., is down about 75 ft. with numerous drifts at various distances from the surface, every one of them, as well as the shaft, displaying large bodies of ore, some of it of remarkably high grade.

**EUREKA.**—Cor. Reese River *Reveille*, Nov. 22d: Quite a stir is looming up among our mining sharps about the late rich strike in the Tiptop mine, Ruby Hill. From the recent explorations a large body of high grade smelting ore has been exposed.

### ELY DISTRICT.

**BULLION.**—Pioche *Record*, Nov. 19th: W. F. & Co. shipped since Nov. 12th, 59 bars valued at \$114,208.34.

**ASSAYED.**—From the 1st of Nov to the 13th, J. Cahill has assayed bullion of the value of \$111,490.08.

**PROGRESSING.**—The head work for the hoiler and engine on the Lightning shaft of the Raymond & Ely Co. has been completed and part of the machinery is already on the ground.

**RESUMED WORK.**—Work has been resumed on the Silver Chief mine, immediately beyond and adjoining the Alps mine. The prospects are most flattering, and the iron ore encountered in the ledge at a depth of 60 ft. is running out and chlorides are coming in. A cross ledge, named the Silver Monarch is also being worked, and at a depth of 7 ft. chlorides were found.

**PIOCHE MINE.** Within a short time this mine will be in full operation again.

### HUMBOLDT.

**BULLION.**—Unionville *Silver State*, Nov. 25th: Amount shipped from the Arizona mine since our last issue, was \$7,834.

**GALENA.**—Cor. same: A rich deposit of galena ore has been struck in the Veritas mine, alias the South Ex. of the Avalanche, one-fourth of a mile south of this town.

### REESE RIVER.

**METACOMB MILL.**—Reese River *Reveille*, Nov. 17th: This mill which has been thoroughly repaired, and the new White or revolving tubular furnace added, has been running for weeks. It is a complete success.

**BREYFOGLE MINE.**—It has been reported, that this mine has undoubtedly been found about 150 miles south of White Pine on the same range of mountains. The lode can be traced for 8 miles and averages \$9,000 to 19,000 per ton.

### WASHOE.

The ore coming from the Crown Point is assaying from \$40 to \$120 per ton.

The yield of the Chollar-Potosi last week was \$42,450.

The new double cages are now in operation in the Halo & Norcross mine.

The mills upon Six and Seven mile Canyons are all in full blast upon ores from the Comstock lode.

**OPHIR SHAFT.**—The new Ophir shaft has reached 1,140 ft.

The timbers are all in place on the big dam of the Union Mill Company on Carson river, and the whole of the work on the structure is fast approaching completion.

**GLOBE MINE.**—Work will probably be resumed in this mine—situated between Gold Hill and American Flat—ere long. No work has been done on the lead for many years. Parties who have been examining it within a few days past find that it contains excellent ore. We were shown a number of assays running from \$40 to nearly \$200—3 or 4 of these assays were over \$150.

### WHITE PINE.

**BULLION.**—White Pine *News*, Nov. 18th: The bullion shipment from W. F. & Co's. office foots up, 5 days, \$65,784.32.

**EBERHARDT.**—The drifts from the Keystone show a small streak of ore.

**NORTH AURORA.**—In the Lady's Chamber 3 drifts are going ahead, northeast and south, to make connection with the Ward Beecher workings, and prospect the ground

between the two mines. There is a favorable indication that the pay-streak extends from the Lady's Chamber through to the Beecher.

**WARD BEECHER.**—65 tons of ore are hoisted daily from this mine through the Buchanan Shaft. The ore body in the Phillips chamber is showing unusually well.

**SOUTH AURORA.**—The drift from the Mitchell shaft to connect with the tunnel and also the one to connect the Turner with the Trewella shaft, started up last week.

**GENESER.**—A body of quartz has come in since last mention was made of the works.

**WARD BEECHER CON.**—The ore now in sight is of a higher grade.

**EAST SHEROYGAN.**—A rich body of ore, showing well in horn silver, was opened out in the Exchange incline recently, and also in the south original shaft. An assay of ore made from the latter turned \$20,264.80.

**GEN. LEE.**—Running ore out through the tunnel from the east drift.

**ENGAR.**—The east drift is pushed ahead from the 100 ft shaft with the usual force on top and below.

### Arizona.

**PINAL MINES.**—*Tucson Citizen*, Nov. 11:—Rich quartz mines have been recently found in the Pinal mountains, from 25 to 30 miles beyond Florence. Considerable of the ore has been brought to Florence, and pronounced worth \$10,000 per ton, but other reports put its value at from \$300 to \$400.

### Colorado.

**SHIPPED.**—*Colorado Miner*, Nov. 23:—The Stewart Silver Reducing Co. have shipped for the week ending Nov. 23d, bullion valued at \$6,558.04 coin; and the International Mill, Argentine, for the same time, bullion valued at \$2,255.50 coin.

The Wilson & Cass dressing works, wet concentration, will start up soon.

The mines in every portion of the country are yielding rich ore in large quantities.

We are under obligations for a specimen taken from the Paymaster lode, Argentine. The ore carries a high percentage of lead, and a respectable percentage of silver. The Paymaster is a first-class mine.

The Cliff mine has been placed in complete mining order, and drifting into the mountain on this vein has commenced. The mine is yielding ore of more than ordinary richness. An assay of average first-class ore lately gave a yield of 930 ozs. per ton.

**PEWABIC G. M. AND S. CO.**—*Central Register*, Nov. 15: This Co. are tunneling the Pewabic Mt., situated at the head of Graham Gulch, one and a half miles southwest from the city. A belt of very rich gold and silver veins are known to cross this mountain. The mouth of the tunnel is a little above the Pewabic lode, and extends southward into the mountain 507 ft. It cuts, in its course, the belt of lodes referred to, at right angles, having already crossed 7 veins, but at too little depth to find them of marked value, until now, in the breast of the tunnel, they are cutting one of great strength. We found 7 ft. in width of vein material already cut, and the south wall not yet reached. This lode is struck by the tunnel about 175 ft. from the surface of the ground, following the dip of the vein. The ore is iron and copper pyrites, and argentiferous galena. An assay gave gold at the rate of \$16.54 per ton, and silver \$31.72, making \$48.26 per ton.

**CARBON.**—The west shaft of the Caribou mine, 200 ft. from the shaft, is now sunk to as good pay as any portion of the mine, making 300 ft. in length on the vein in which the exploration shows no dead ground, but an even crevice of the richest silver ore. The main shaft is constantly improving as depth is gained.

The Seven-Thirty is worked by a level westward from the main shaft, on a vein of 18-inches of the highest grade ores.

There is much interest in the development of the Wahash lode by Corning & Co., who are desirous of erecting reduction works as soon as they become satisfied that the pay vein of their mine is permanent. The depth attained is about 35 ft., and thus far it has proved regular and rich.

The Grand View Co. have completed their buildings over the mine, and are again raising \$500 ore.

**CARIBOU POST, NOV. 18:**—The Hinds & Heter's stamp mill, recently removed here from North Clear Creek, and put up to water-power on the Middle Boulder, at Brown's, started on Monday.

**IDAHO LODE.**—*Central Herald*, Nov. 15:—At present the mine is not being worked to anything like its capacity, as the owners are negotiating a sale.

Last week the Black Hawk tunnel, below Gregory Point, advanced 12 ft. further into the mountain and is now 400 feet long. The head of the tunnel is near a shaft of the Fisk lode, and will intersect the Fisk crevice about 75 ft. below the bottom of the deepest shaft.

### Idaho.

**ASSAYS.**—*Idaho World*, Nov. 16:—We are indebted to B. M. DuRell, for the following statistics of assays of gold dust made at the Banking House of DuRell & Co., of this city, during the month of Oct.: Number of bars run, 121; value, \$92,608.75.

**ENLARGING DITCH.**—K. P. Plowman has been engaged for several weeks in enlarging his ditch, which taps Moro Creek 7 or 8 miles above Idaho City. The job will be completed in about 10 days.

**WARRENS.**—*Cor. Lewiston Journal*, Nov. 11: The Resene ledge continues to yield up to expectation. The receipts week before last were \$750, and last week \$1,500, over expenses. The lowest levels, both east and west, continue to "shell out" rock of good quality and quantity. Negotiations have been entered into between Mr. Isenbach and the owners of the former 5-stamp quartz mill of Souther & Co., near Florence, for its purchase.

### Montana.

**THE SMELTING WORKS.**—*Helena Gazette*, Nov. 13th: A short visit exhibited to us the fact that they are rapidly approaching completion. The main building is finished, and to-day the 4 stacks, or furnaces, will be completed. The engine and boiler are in place, and the well nearly finished.

**SPICKLEN TROUT LEAD.**—This silver lode, at Phillipsburg has been leased to Col. Lyon. The Colonel is down 85 ft. and has a 9 ft. crevice in the Lower level. He is running his mill day and night—running a No. 40 screen.

**RICH RETURN.**—On Friday Judge Turnley cleaned up a run of 8 tons of selected ore, from the Whitlatch mines on the Park Lode, which yielded \$900.

**PROSPECTING PARTY.**—*Missoula Pioneer*, Nov. 16th: Prof. House and party returned last week from their prospecting trip across the Bitter Root and Missoula rivers.

**PHILLIPSBURG ITEMS.**—*Helena Herald*, Nov. 16th: Capt. Plaisted and James H. Brown have leased or are about to lease, the St. Louis mill, to crush custom ore. They have a few men opening ledges.

Col. Lyon's mill is completed, and the process of reducing the ores of the Trout mine has already been inaugurated by roasting with salt preparatory to amalgamating, which will soon be commenced. He has over 20 men employed.

Estell, Holland & Ullery have discovered a new ledge near the old Camanche, which shows a good quality and fair quantity of milling ore.

**CABLE.**—At the lower level from the Cameron shaft is in 140 feet, and prospects are favorable for striking quartz soon. The mill will start up under favorable auspices in 2 weeks. The Miners & Mechanics tunnel is in about 1,160 ft. in the vicinity of the lead, and will strike it 350 ft. from the surface.

### Utah.

**BULLION.**—S. L. "Tribune," Nov. 23d: W. F. & Co. received on the 16th, from Raymond & Ely, Pioche, 16 bars silver bullion, 2,696 lbs., valued at \$51,305.46., consigned to New York. On the 11th they received from the Meadow Valley Co., 14 bars (1,627 lbs.) of silver bullion valued at \$16,491.68 coin, consigned to N. Y. On the 20th they received from Raymond & Ely, Pioche, 16 bars of fine bullion—\$52,756.17, to be forwarded to N. Y.; and on the 22d, they shipped to New York, 16 bars of fine bullion from the Meadow Valley Works, worth \$20,743.24.

**WOOD & CUTTING** shipped on 18th, 4 loads of base bullion East; 1 to Detroit, and 3 to New York. Two of the cars were from the Sultana works, in American Fork. On the 21st they shipped to New York 2 car loads from the Sultana works, American Fork.

**OPERA.**—The 3 smelting furnaces lying idle for months, are all to start up for a winter's run. The old Pioneer furnace has been purchased for S. Waterman, and will be run under the superintendence of A. L. Brown. The Hidden Treasure, Sevier and Last Chance are being vigorously worked, and are producing large quantities of ore.

The Wasatch smelter, has been sold to the Utah M. and S. Co. (the English Co.), who are putting it in condition to run for the winter.

The Lion Co. are pushing work on their mines and shipping quantities of rich ore. The Silver Exchange is working and shipping ore, and ranks second only to the Lion in richness.

**TINTIC.**—A large number of the mines will be worked through the winter. Among these are the Swansea, Sunbeam, Argenta, Black Dragon, Galena Bed and James Bird.

**OLD NEBRO.**—In the Olive Branch lode 2 men take out from 2 to 3 tons per day, of galena and carbonate ores, containing 75 per cent. lead, and 40 oz. of silver.

**COLUMBIA DIST.**—Considerable work has been done on the Gold Eagle, Liberty Hill, and a fine body of ore is in sight. The ledge is from 2½ to 3 ft. in width, dipping to the west on an angle of 45 degrees. The ore is carbonate and galena, assaying \$75 silver per ton and carrying 80 per cent. lead.

Montezuma mine, on Montezuma Hill, a spur running parallel with Liberty hill is looking well for the amount of work done. Upon this hill are the Valley Tan, Silver Cross, Lookout and Chimney Corner, and all are looking well, galena and carbonate ore being found in most of them. The Valley Tan shows a body of high-grade ore. Liberal Hill is another spur running

parallel with the Montezuma. Upon it are the Utah Chief, Washington North and South, St. Louis, and others. The Washingtons are the most developed and show a different class of ore, principally carbonate, intermixed with small bunches of galena and of a very high grade. The ledge is about 5 ft. wide, and an incline down 10 ft. shows a solid ledge of ore.

**LION HILL.**—*Cor. S. L. Herald*, Nov. 18th: The Tiger mine is working 15 men and taking out good ore. The Silver Exchange has a shaft down 45 ft. sunk within a short distance from the open cut into the mine. This shaft follows a vein of splendid ore about 20 inches in width to its entire depth. This mine never looked so well as at present, and the same may be said of the White Star, the adjoining claim on the east. The Lion with its interlacing connections is reported sold to an English company. No work is being done upon it, or them, and the sale is reported as the cause.

**CAMP LLOYN.**—The contract price at which the Silver Cloud mine was sold was \$500,000, and of this sum \$135,000, has been paid. The owners have leased the Walker Bro's. mill, and have made a contract with Mr. Standish to freight ore (of which there is a large quantity on the dump) from the mine to the mill. The Queen of the West, shows a large quantity of medium grade milling ore on the dump, with an excellent prospect of a large and permanent lode of the same class of ore in the mine. Preparations are being made to work extensively the Sparrow Hawk, Last Chance, and Marian mines; and active work is to be immediately resumed upon the Mormon Chief and Grecian Bend mines on the south side of the cañon. Under the excitement inspired by the heavy sales of mining property on the north side, the mines are being energetically developed. They lie in the direct line of the mines of Lion Hill, in East Cañon dist., and resemble them in the character of the ores they yield, and in the country rock formation. Among these mines are the Silver Circle and Flying Dutchman, with bold croppings—assaying upon an average \$42 per ton; the Red Eagle, with an average assay of \$150 per ton in silver; the Gentle Belle, an extension of the Eagle, and the Lewiston in the same vicinity.

### New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

**OXFORD GALENA MINING CO.**—Capital stock, \$2,000,000 in 20,000 shares. Trustees: W. H. Patterson, N. Hamilton, W. E. Lamb, C. A. Washburn, O. H. La Grange, S. B. McKee and O. C. Milton.

**LEMON MILL AND MINING CO.**—Capital stock, \$200,000 in 2,000 shares. Trustees: G. W. Clark, H. H. Schafer, J. Hahn, J. Fay and F. A. Alvan.

**ALPINE GOLD MILL AND MINING CO.**—Capital stock, \$1,200,000 in 1,200 shares. Trustees: J. W. Gashwiler, J. T. Boyd, C. N. Felton, T. H. Moyan and T. M. Luther.

**HAPPY CAMP HYDRAULIC MINING CO.**—Capital stock, \$1,200,000 in 12,000 shares. Trustees: W. W. Knight, W. H. Miller, H. C. Lee, Sannell Ambrose and J. R. Bell.

**BOWER GOLD MINING CO.**—Capital stock, \$1,000,000 in 20,000 shares. Trustees: G. L. Bradley, G. Bower, C. E. Elliott, Ira G. Hoyt and P. Bramlow.

**JUSTICE MINING CO.**—Capital stock, \$2,100,000 in 21,000 shares. Trustees: R. F. Morrow, G. Beaver, G. A. Thorne, G. W. Gordon and T. H. Williams.

**BOWERY CON. MILL AND MINING CO.**—Capital stock, \$3,000,000 in 30,000 shares. Trustees: L. J. Hanchett, H. Mayers, N. C. Fassett, J. Spear and J. D. Fry.

The following have filed certificates in the Secretary of State's office, Sacramento:

**SOUTH GULCH GRAVEL MINING CO.**—Capital stock, \$120,000 in 1,200 shares. Trustees: G. W. Gilmore, T. F. Cronise, G. F. Sharp and G. B. Merrill.

**SUGAR LOAF HYDRAULIC MINING CO.**—Capital stock, \$5,000 in 50 shares. Trustees: C. Waldeyer, D. D. Harris and C. F. Colton.

**SAN DIEGO AND SAN BERNARDINO R. R. CO.**—Capital stock, \$1,500,000 in 15,000 shares. Directors: D. W. Strong, J. W. North, A. D. Bomen, S. S. Chilverwell, D. B. Hoffman, W. H. Ogden and T. J. Higgings.

**LA JUNA WARM SPRINGS CO.**—Capital stock, \$10,000 with the right to increase the same to \$50,000. No. of shares, 500. Trustees: B. Hoffman, J. F. Gould, J. W. Strong and D. W. Strong.

**THE Meadow Valley Mining Company** will present to their retiring Superintendent, Mr. Chas. Forman, a handsome service of plate, in recognition of his satisfactory discharge of duty.

The tobacco manufacturers of the United States number 1,023, of which North Carolina has 205, Virginia 185, and Missouri 102.

### San Francisco Mining Stock Market.

THURSDAY EVE., Nov. 30, 1871.

Stocks in the early part of the week were quiet and irregular, but Wednesday morning were active and firm, Golden Chariot being the feature and carrying up other Idaho Stocks with it. It rose from \$5 to \$21 in 48 hours. The sales at the San Francisco Stock Board for the week ending Wednesday, November 22d, were \$2,517,500. Chas. Forman has resigned the Superintendency of the Meadow Valley Mine, and was tendered complimentary resolutions by the Board of Directors, who appointed J. T. Cassel to the vacancy. The weekly report of the Hale & Norcross mine shows 1,000 tons of ore extracted, and that of the Savage 740 tons. The special meeting of the Daney mine, to be held on December 28th, is called for the purpose of taking into consideration the increase of the capital stock from \$180,000 in 8,000 shares, to \$2,400,000 in 24,000 shares. From the Meadow Valley mine \$108,000 have been received on the November account. Thursday being set apart as a day of Thanksgiving there was no session of the Stock Board and our reports close with Wednesday afternoon's sales.

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

#### FOR THE WEEK ENDING NOVEMBER 14.

ASH-PAN FOR STEAM BOILERS.—John Gates, Portland, Oregon.

ANIMAL TRAP.—Nathan S. Howell, Tualatin, Oregon.

BALING PRESS.—Thomas J. Corning, San José, Cal.

#### TRADE-MARK.

MEDICINES.—John J. Haley, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible by telegraph or otherwise at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### The Gravel Hills of Placerville.

[Concluded.]

The physical characteristics and appearance of the black lava are entirely different from the white. Its general color (where not stained red by decomposition and higher oxidation of the protoxide and magnetic oxide of iron which it contains), ranges from an ashy or leaden hue, to a dark iron gray. In texture it is generally a well defined breccia consisting chiefly of angular fragments of all sizes and shapes, from the most impalpably fine particles which make up the matrix in which the larger fragments are imbedded, up to blocks of several tons in weight, the whole mass being often rather than otherwise, in this vicinity, firmly cemented together into a hard and solid rock. A certain proportion of the boulders which it contains are more or less rounded by the action of water. When this "black lava" is hard, and overlies in any considerable thickness the auriferous gravel, it forms, of course, a complete obstacle to the profitable working of the bank by hydraulic means, unless the gravel beneath is uncommonly rich, or else, being only moderately rich, the bank is very deep, and easily worked, when once uncovered.

In the Oldfield claim, now owned and worked by Chinese, this lava forms a capping from 20 to 30 feet thick over the gravel, so that it has to be blasted and broken into fragments small enough to be handled, and this removed before the gravel under it can be worked. Sometimes, however, if under-mined, a crack will open from top to bottom through this capping, a short distance back from the face of the bank and the huge block so formed will topple over into the claim where they are left if the ground has been already worked. Some of these blocks are many hundreds of tons in weight. One of the largest of them was measured and found to be 55 feet in length, while in no direction through the center was its diameter less than 25 feet. Its volume must be very nearly equivalent to, if it does not exceed, that of a 30-foot solid cube, and its weight in the vicinity of 2,000 tons. It is not difficult to understand that the gravel must be rich, which will pay even Chinese for working it under such disadvantages, and in the face of such an obstacle.

With reference to gravel channels, I have no doubt that the opinion of well informed practical miners here, so far as they go, with respect to the existence of anything like distinct or well defined channels, are very near the truth. It is extremely probable for example, that a deep, continuous channel, known here as the blue lead, extends from White Rock in a general southerly direction, beneath Dirty Flat and the two intervening ridges, to the extreme south end of Smith's Flat. But whether this channel from there on continues its general southerly course, coming out on the Wehner Creek side at, or in the vicinity of, the old "Try Again" tunnel, or whether it makes a sharp bend to the southward under Prospect Flat, is a question impossible to answer with certainty until developments have been pushed further under ground. Moreover, the apparent direction of the channel at Prospect Flat is southwesterly, which is its proper direction in case it should connect above with Smith's Flat channel. As all work at the "Try Again" tunnel, was long since abandoned, I do not know the precise character of the gravel or the appearance of the channel here, or what fur-

ther evidence there may have been in favor of its being the same as the Smith's Flat channel.

With reference to the general question of the origin and distribution of the auriferous gravel itself there have been no end of theories, and every agency that is capable of moving rocks, from salt water oceans to enormous glaciers and floating icebergs, has been called in to account for the phenomenon. With reference to most of these theories, it will only be necessary here to state the fact that no well informed man can study carefully for himself in the field over any considerable extent of this country, the character and distribution of this gravel, and the detailed structure of the banks, with the fossils which they contain without being led to the irresistible conclusion that there is but one possible agency, which is at all capable of satisfactorily accounting for the complex and intricate phenomena, and that this is to be found in the action of fresh and running waters.

This agency was involved in the old "Blue Lead Theory" which has been for so many years a favorite, not only among the best informed practical men, but among leading geologists and mining engineers as well. The gist of this theory may be stated in a few words by saying that it involved the supposition of the former existence here, of a great river with its branches, the main trunk of this river being supposed to hold for one or two hundred miles, if not more, a general southeasterly course, nearly parallel with the present main crest of the Sierra, before the mountains were uplifted. But the detailed and extensive explorations of the gravel mines which have been made during the past two years by the State Geological Survey, have developed among other things, the fact that this theory too, is not only inadequate to account for the complex facts, but that it is not unfrequently in direct conflict with them. The questions involved are extremely complex, and it is no wonder that in the absence of systematic and extensive investigations of the facts in the field, the theories at first propounded should have been wide of the mark. Our own work in this direction is by no means as yet complete. What the true theory is it would be premature to attempt to develop here. But it is rapidly assuming shape in our minds, and the whole subject will be thoroughly discussed in the forthcoming Geological Report of Prof. J. D. Whitney, provided the coming Legislature shall furnish the requisite means for their completion and publication.

One other point may be noted as a matter of curiosity, if nothing more, which is the finding of diamonds in the auriferous gravel. During my stay here I have seen and recognized two of these diamonds in the hands of people who did not know what they were, but saved them merely as curiosities. The commonest shape of the diamond in this country is that of a solid or crystal, having twenty-four triangular faces. And another remarkable and easily distinguished peculiarity is, that these faces, instead of being perfectly flat, as is generally the case with the faces of quartz and other crystals, are very often curved, the center of each face being a little higher than the surface towards the edges. The diamond surface, moreover, is extremely hard, and scratches quartz with the greatest ease.

### Water Pressure.

EDS. PRESS:—Suppose we have two pipes of equal length, placed together in a perpendicular position, one of which is of a regular size its whole length, the other graduated in size, being small at the lower end, and larger as it goes up, both pipes being of the same size at the lower ends, the graduated pipe to contain (for instance), four times the quantity that the other is capable of holding. Now, when both pipes are filled with water, is there any difference in the pressure of the water at the lower extremity (no water being allowed to escape from either pipe); by answering the above question you will greatly oblige, etc. T. R. HUTCHINSON.

Ukiah, Nov. 13th, 1871.

There will be no difference in the pressure of water in the pipes above described; but the graduated pipe will discharge a larger quantity, provided both are fed to their fullest capacity and under a uniform pressure; for the reason that there will be less friction to be overcome by the water flowing through the graduated, than by that flowing through the uniform pipe.

MECHANICS, write for the PRESS.

### A Patent Card Holder.

The cards are held in the ornamental work or frame, here represented, by inserting their lower edges behind the spring points shown on the vertical parts of the frame. The holders are made simply by punching the points out of a sheet of thin brass, which has spring enough in the metal to make the holding points elastic. The cards are all held so firmly that jarring the frame, or a current of air will not disarrange them in the least. It was exhibited at the Mechanics' Fair, by Weister

& Co., No. 17, New Montgomery street, who will sell frames or rights. Several novel card holders are sold in New York; but this seems to us the most desirable and one of the cheapest. For rights for other States, address Miles Bros., Fulton street, New York.

### Sugar from Grapes.

EDS. PRESS:—Would you have the goodness to inform me, through the PRESS, if making sugar from grapes has ever been tried? Last week, when crushing grapes for wine, I took a 5-quart saucepan and filled it with juice and placed it on the cooking stove, and to my surprise I found, by the time it had half boiled down, it had become a thick, heavy syrup, and somewhat burned.

Would it not be worth while to call the attention of some of the sugar-makers to it, as grapes can be raised for less money than beets? S. B. PENTLAND.

Common crystallized sugar, as we have repeatedly stated in the PRESS, cannot be made from grapes. Grape juice, when carefully boiled down, gradually acquires a syrupy consistence. If the boiling is carried to a sufficient extent, and the resulting syrup allowed to cool and remain undisturbed for several days, it hardens into whitish granular tufts, similar to the "sugar" sometimes seen on "candied" raisins—in fact, the two substances are precisely alike. If this substance is submitted to a heat of 220°, it melts into a thin liquid, which, on again cooling, takes the consistency and appearance of honey. If, in this condition, it is exposed for a long time to the air, it will again become granulated.

If, in the first condition of granulation, it is boiled at a temperature of 270°, instead of 220°, it gives off more of its water (one-tenth of its weight) and hardens, on cooling, into a bright yellow, brittle mass; which, however, will soon absorb the one-tenth of water which it has lost in boiling, and deliquesce or "slack," like poor molasses candy. The only serviceable way to utilize grape sugar, is in its character as a syrup boiled down at a temperature of 220°.

Grape sugar, even when granulated and dry, possesses only two-fifths the sweetening power of crystallized cane or beet sugar. It is not, however, profitable to make it, either as a syrup or sugar, from grapes, for the reason that precisely the same article can be made, by a cheap chemical process, from the starch of potatoes or corn, much cheaper and equally as good.

### Extension of Patent Refused.

Important to Farmers and Plow Manufacturers.

Gang plows are one of the institutions of the Pacific Coast, and more patents are taken out for them than in any other State. The reason of this is, that farms here are usually of large extent, comprising hundreds and sometimes thousands of acres, and gang plows can be worked to more advantage than on most of the farms in the Eastern States. They give satisfaction wherever used, and are being generally adopted. The *Scientific American* of a recent date says:

The application of George W. Hildreth, of Lockport, N. Y., for an extension of his patent for a gang plow, has been refused. This patent was reissued last December. The leading features of the invention are these: crank supports, for adjusting the height of the frame from the ground; supporting wheels, so adjusted as to run upon different planes, one to run in the furrow and the others upon the sod; the axle made adjustable laterally; in brief, the axle has a triple motion, upward, downward and lateral, and it also vibrates on the center bolt. This plow is well known on the Pacific coast, and has been manufactured by Baker & Hamilton, of San Francisco. It is claimed that it will plow from two to four acres a day more than a common plow. The applicant appears to have been unfortunate in reaping no profits from his invention. He says: "I am getting towards three score years and ten, and have had a hard, up-hill business for years; and this gang plow business has contributed largely to my misfortunes." The extension was strongly opposed, and remonstrants claim that applicant has not used due diligence in introducing his alleged invention into general use, and that in his reissue he claims more than is his invention. A suit for infringement of this patent has lately been brought against Treadwell & Co., the damages being fixed at \$50,000.

### California Autumn Tinted Leaves.

It is generally remarked that in California we are denied the beautiful tints of autumn foliage so highly enjoyed by the lovers of natural beauty in New England and other Eastern States. But this opinion is not entirely true. We were shown by a lady in Oakland, a fine selection of tinted grape leaves received from Dr. Streunzel, of Martinez, which were quite varied and of as delicate a hue as any beautiful autumn tints we ever saw in New England. These leaves we observed were very tenderly cared for, and more highly prized for their lasting beauty than the collection of choice grapes of the rarest cultivation that came with them. Whether these foliage tints are due to the special climate of the valley in which they grew, or other peculiar reasons, we would thank the Doctor to inform us.

THE BEST FISHING PLACE FOR SALMON in the Sacramento river, is well known to be about Rio Vista. The reason of this, as explained by Mr. B. B. Redding, State Fish Commissioner, is as follows:—When the salmon return from the ocean they are infested with parasites which they rid themselves of by tarrying a while at this point, where the salt and fresh waters mingle. Again, in returning, a similar halt is made to rid themselves of fresh water parasites thus offering an extended and profitable fishing season at Rio Vista, while other parts of the stream are employed by Mr. Salmon more strictly as a thoroughfare.

At San Rafael, an association has purchased a tract of 4,000 acres adjoining the town, and it is contemplated to divide the tract into villa sites, and to exclude all unwholesome factories and trades from the new site.

DURING the month of October last, the Eastern shipments by railroad from Marysville embraced 3,460 pounds of wine, 60,284 pounds of fruit, and 2,443 pounds of unspecified freight.

WILD GAME is becoming plenty. It is said that 95 geese were killed at three shots on a lake near Salinas, Monterey county, last week.

## USEFUL INFORMATION.

## Position and Motion.

Some interesting facts regarding standing, walking, and lying down are grouped in a lecture by Prof. Burt G. Wilder. In man the great toe is the essential part of the foot in standing and walking. In the ape this is a thumb, standing out from the side of the foot, and has no power of supporting or propelling. The ape cannot carry himself erect. But put man on all fours, like an ape, and the enormous disadvantage appears at once. The head hangs as a great weight, with no adequate muscles to support it. The curve of the back is such that the knees touch the ground, and we have to raise the thighs in order to make the feet touch the ground. Man's foot is called a plantigrade foot—that is, it has the whole sole flat upon the ground. One other animal has a plantigrade foot, but he uses it in a different fashion; he lifts the whole foot together and puts it down flat, while the man strikes with the heel first and rolls forward upon each toe alternately. The erect attitude is maintained only by a constant thought unconscious control of the muscles of the leg by the brain. The length of the man is greater when he is lying flat than his height when he is standing. In the former case the body stretches itself; in the latter it settles down upon itself. A man is shorter when standing on one foot alone. He is shorter again when walking. For this reason ladies' skirts, which just clear the ground when they are standing, drag on the pavement as soon as they begin to walk. The different parts of the body are bent upon each other, and also swing from one side to the other. A very singular fact connected with walking is that one side of the body tends to outwalk the other. Persons with their eyes shut cannot walk in a straight line for any length of time; and persons who are lost in the woods or prairies are sure to travel in a circle. There is a greater tendency to wander off to the right than to the left.

**DRYING-OIL SUBSTITUTE.**—A composition for mixing with white-lead and other colors, to form a paint in lieu of linseed oil, turpentine, and the usual driers, has been lately brought out. The advantages claimed for this vehicle are, it dries very quickly. In less than half an hour after application it is sufficiently dry and hard to receive another coat. It is perfectly inodorous. A room can be used the same day it is painted. It is peculiarly adapted for painting offices, counting-houses, stairs, ships' cabins, and all work where time is an object. It cleans readily, and is not affected by soap or alkalis. It is economical in use, though the composition is in itself necessarily from the materials employed, dearer than linseed oil. In consequence of the body contained in the composition, three coats of paint mixed with it are equal to four of ordinary paint; and the great saving in the time always lost by workmen in going from one job to another, or waiting until such paint is dry, is more than sufficient compensation for the greater original cost. For example a street-door, which requires the attendance of a workman on five several days to complete the painting and varnishing, can by the use of this composition, be painted with four coats and varnished in one day. The material consists of methylated spirit, shell-lac, and castor-oil.—*London Artizan.*

**SMOTHERING A BURNING MINE.**—Some months ago a coal mine at Mauch Chunk, Pa., caught fire. The ordinary appliances for extinguishing such fires failing, the company has adopted the plan of a chemist who has undertaken to extinguish it with ammoniacal gas. The entrance to the mine has been closed up, and in front of it works have been constructed for generating the gas and forcing it into the mine. Two barrels of sal-ammoniac per day are used, and from the reports made during our visit, it is believed that the experiment will be a complete success, and that in a very short time the fire will be completely extinct. Such success will be most important in future cases of fire in coal mines; for there are cases where the fire has lasted for many years, as in the mine at Summit Hill, which will probably not be extinct until the whole vein is burned out. *Ex.*

The forests are dying out in certain parts of Virginia. The chestnut trees have already submitted to some deleterious agency, and their growth is nearly exhausted; and this year the oak, and in fact all the trees of the forest in certain sections are dying. No explanation of this disastrous visitation has yet been given.

**HOW A PERSON FEELS AT THE INSTANT OF A RAILROAD COLLISION.**—Col. W. W. Bennet was in the street railroad car which was recently run over, in Jersey City, by the New Jersey railroad train. The locomotive was going at the rate of 30 miles an hour when it struck the car a little quartering, lifting it some three feet from the track and smashing it into a thousand pieces. The car was crowded, and contained from 36 to 40 persons, two-thirds of whom were ladies. The Colonel, who was sitting near the door, perceiving there was no escape awaited the shock calmly. He says:—"Immediately the crash came, but I felt no movement of my body on the car, nor any pain; I became insensible; when I recovered I found myself on the cow-catcher of the locomotive, pushing toward Philadelphia; I was lying on my back with a body under me and a body over me, and my left hand was grasping a part of the locomotive; when the engine stopped, I crossed to the north side of the track, and started home with my face covered with blood; as I crossed the walk I saw the body of a man on the ground, and I tried to call for help but could not speak; I felt as if I was under the influence of a hideous dream."

Another person's experience was given thus:—"I heard a peculiar, rumbling sound, and afterwards terrible shrieks; as swift as thought came a crash of iron, glass and wood. I was lifted, as it were, and thrown, I knew not where; I struck the mud, and then knew that I was out of the car; I found I was in the cavity between the upper and lower tracks, and as I was lying in this hole the train was passing over me; I did not dare to stir lest I should lose a limb; I found that with the exception of slight bruises about the thighs I was uninjured; I was thrown 20 feet from the car."

**ANCIENT MODE OF KEEPING TIME.**—Bowls were used at a very early day for measuring time, from which water, drop by drop, was discharged through a small aperture. Such bowls were called water-clocks—*clepsydræ*. It was then observed how much water from such a bowl or cask, from sunrise to the shortest shadow, or noon, trickled down into another bowl placed beneath; and this time being the half of the whole solar day, was divided into six hours. Consequently, they took a sixth of the water which had trickled down, poured it into the upper bowl, and, this discharged, one hour had expired. But afterward a more convenient arrangement was made. They observed how high the water at each hour rose in the lower bowl, marked these points, and counted them, thus finding out how many hours there were till sunrise. With the Chinese, water-clocks, or *clepsydræ*, are very old. They used a round vessel, filled with water, with a little hole in the bottom, which was placed upon another vessel. When the water in the upper vessel pressed down into the lower vessel, it subsided by degrees, announcing thereby the parts of time elapsed. The Babylonians are said to have used such instruments; from them the Greeks of Asia Minor got them, at the time of King Cyrus, about the year 550 before Christ. But the Romans did not get the first water-clock before the year 160 before Christ.

**HOW FORESTS ARE PRESERVED IN EUROPE.** It is estimated that there yet remain in France, 2,700,000 acres of State forest, the revenue of which previous to the recent war, was \$8,700,000. Bavaria has about 2,000,000 acres of forest; Prussia, as it existed before the war, had upwards of 5,000,000 acres. In each of these countries, schools of forestry, under State control, are supported, in which men are trained in the scientific and economical management of the State timber-lands.

**SUBSTITUTE FOR GUTTA-PERCHA.**—A juice extracted from a shrub which abounds in Guinea under the name of *boleta*, is found, according to report, to be superior for many purposes to gutta-percha. The juice coagulates quickly when exposed to the air, and is without any disagreeable odor. When worked up it is more flexible than gutta-percha, while it appears to possess equal strength and durability.

The word Canada had a singular origin. When the Spaniards first visited the country they found neither gold nor silver, and went off saying "A Canadada," (there is nothing here). When the French came, the Indians tried to frighten them off by repeating it over and over, but the new comers took it for the name of the land, and so called it Canada.

## GOOD HEALTH.

## How to Secure Long Life.

Dr. Dio Lewis recommends that all who would secure a clear, fresh skin, bright eye, active limbs, a quick brain, and a cheerful, pleasant temper, and thus enjoy a long life, should live about as follows:

## Breakfast.

Oat meal porridge, with milk and sugar. Or, Graham mush, with a little good syrup.

Or, cracked wheat, with milk and sugar. Or, baked potatoes with bread and butter.

Or, beef steak or mutton chop, with baked potatoes and bread and butter.

If you are thin, and need fat, use the first three; if you are too fat, use the last named two.

Drink cold water, or a little weak coffee.

## Dinner.

Beef or mutton, roasted or stewed, with any vegetables you may like (though tomatoes should be used very sparingly), good bread and butter, and close the meal with a glass of weak lemonade. Eat no dessert, unless it be a little fruit, and eat nothing more until the next morning.

There is no rule in regard to diet about which I am so fixed in my convictions, as that nothing should be eaten after dinner, and I think that the dinner should be taken early in the day; not later, if it can be so managed, than two o'clock. In regard to the precise hour for the dinner, I am not so clear, though for myself one o'clock is the best hour; but in reference to the omission of the third meal, I have, after long observation no doubt whatever.

Hundreds of persons have come to me with indigestion in some of its many forms and have experienced such relief in a single week from omitting the supper, that I have, for a number of years, depended upon this point in the diet as the best item in my prescriptions for indigestion. I have never met one person suffering from indigestion, who was not greatly relieved at once, by omitting the third meal.

Cooked fruit is best for persons of weak digestion. I have met hundreds of people who would digest a large beef steak without a pang, but who could not manage a single uncooked apple.

I think certain dietetic reformers have somewhat overrated the value of fruit.

Avoid cake, pie, all sweetmeats, nuts, raisins and candies.

Manage your stomach as above, and at the end of ten years you will look back upon these table habits as the source of great advantages and happiness.

For thirty years I have been a constant and careful observer (I have no hobbies about diet), and in the light of my own experience and these long observations, I assure you that the table of habits I have advised, are vital to your health and happiness.

Pimples, blotches, yellow spots, nasal catarrh, biliousness, liver torpidity, constipation, sleepiness, dullness, low spirits, and many other common affections would generally disappear with the adoption of these rules.

[We will add, for the satisfaction of our readers, that Dr. Lewis, who here intimates that he practices what he preaches, presents in his own person about as fine an example of genial good health and wide-awake-tiveness as one ever meets.]

**INJURIOUS EFFECTS OF TURPENTINE.**—The *Manufacturer and Builder* says:—"Experience has taught that the so-called lead-paralysis, common among painters in the form of a loss of motion of the wrist joints, is chiefly produced by the habit of washing the hands in turpentine. It is probable that it is not the turpentine alone which produces this fatal result, but chiefly the particles of lead or zinc paint on the hands, which, by the turpentine, are brought in a condition to penetrate the skin more readily and to be absorbed; therefore, painters should avoid, as much as possible, the use of turpentine for washing the hands."

**CURIOUS FRAUD.**—The *Boston Journal of Chemistry* says, that "German saffron," which has been for a long time quite scarce and high, has recently been largely substituted by some enterprising cheat, who has produced a similar article for logwood and fustic moistened with heavy syrup, so ingeniously prepared as to deceive some of the most expert druggists. The amount upon the market is thought to be quite large, and it becomes druggists to examine closely this article whenever they purchase.

## Don't Rock the Cradle.

Even before the babe has seen the light, or very soon thereafter, has this instrument of unnatural oscillatory motion been prepared for its reception, having been deemed necessary, and for what? Mothers, did you ever ponder on the philosophy of this almost constant rocking of your child during its sleeping hours, unless you too are sleeping and cannot give the cradle a jog? You reply that you have thought no farther than this—that you have so much to do that it is a great object to keep the baby sleeping as long as possible, judging that sleep cannot harm the child, and the relief to you is so great.

You are part right. All sleep not superinduced by narcotics or by this soporific motion tends to good; farther than this to harm. The mother's arms while nursing her infant at stated, regular intervals, is all the cradle nature ever designed; and if it forgets its cunning and yields to the drowsy god, they quietly lay it in its little cot, supposing of course you understand that the best good of both yourself and child demands a crib by your bedside, where any little attention it may need may be readily rendered, instead of necessitating it not only to take into its tender, delicate lungs, the unhealthy emanations from the bodies of one or both of its parents, but also their magnetisms, which in far too many cases is detrimental from various causes, either the use of tobacco, poisoning every tissue, or spirituous liquors in the form of beverages or medicines. The time is slowly but surely coming when this cannot with truth be said, that parents poison their children in this manner; but it is with the present we have to deal, preparing the way for this coming time.

Leaving this phase of a very important subject for a future article, I will return to my subject—cradle rocking. "But how can this injure the child? I have always seen children rocked with no ill results," you reply. But how do you know that? Did you ever candidly weigh your child's best good against your work, or pleasure, and determine which turned the scale? I fear not in the child's favor, if you still persist in keeping one foot on the rocker, while the hands are busy, mayhap in fashioning and ornamenting its clothes to please the eye of the beholder, instead of making them for comfort, which still may be tasty. Reflect upon the probable effect on your brain, the seat of thought and reflection, of this long-continued motion, such as is given the child in rocking, and think you, it would tend to any concentration, any strengthening of power? Nay, but the reverse, and the brain of the infant is far more susceptible to the disturbance of its forces than the adult, and needs but to expand and grow normally in a quiet sleep induced by a healthy action of nature's forces. Mothers, study how to thus create healthy bodies, then the sleep will be quiet and refreshing, and your days and nights glide smoothly on.—*Central City Gazette.*

**A SINGULAR CASE.**—The *Lewiston Journal* says: Dr. Bill has in his possession a diphtheria membrane, removed from the throat of a girl of fifteen, who was attacked with the severest type of this terrible disease. The false membrane is about three inches in length, completely preserved, and is a perfect cast of the air passage from which it came. The film is a thick, white, tough, leathery substance, presenting the well known characteristics observed in attacks of this disease. The girl and her sister came to this city from the eastern part of the State to work in the mills, and was unwell on her arrival. She went to work one day, however, when she was taken down ill with diphtheria. The usual treatment in such cases was resorted to, but the patient grew worse, and breathed with great difficulty. On Sunday she had a violent fit of coughing, and seemed to be strangling. The nurse who had charge of her had the presence of mind to put her finger down the girl's throat, and seized the end of something which appeared loose there, and pulled out what proved to be the false membrane of which we have spoken. The presence of mind of the nurse saved the girl, who is recovering.

**THE MAGIC LANTERN IN DISEASE.**—The magic lantern has been successfully applied in London to the study of diseases of the skin, by Dr. Balmanno Squire. A transparent photograph of the patient is taken, then placed in a magic lantern; a strong hydro-oxygen light casts the figure enlarged on a white sheet, and in this way the smallest details are brought out with astonishing minuteness.

Per line.....25 .80 \$2.00 \$5.00  
One-half inch.....\$1.00 \$3.00 7.50 20.00  
One inch.....2.00 5.00 14.00 36.00

Large advertisements at favorable rates. Special or  
reading notices, legal advertisements, notices appearing  
in extraordinary type or in particular parts of the paper,  
inserted at special rates.

SUBSCRIPTIONS payable in advance.—For one year, \$4;  
six months, \$2.50; three months, \$1.25. Clubs of ten  
names or more, \$3 each per annum. \$5, in advance.  
will pay for 1½ year. Remittances by registered letters  
or P. O. orders at our risk.

### San Francisco:

Saturday Morning, Dec. 2, 1871.

### Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, Nov. 29, 1871.—Legal  
Tenders buying 90½; selling, 90½. Gold in New York  
to-day, 110½.

### Table of Contents.

Aveling & Porter's Road and Farm Engine— Ill.....	337
MECHANICAL PROGRESS.—Engraving and Drill- ing by the Sand Blast; Finishing Steel; A New Bronze; Dies for Thread-cutting; New York Docks; Ornamenting Metals.....	337
SCIENTIFIC PROGRESS.—Artificial Formation of Organic Bodies; A New Zinc Paint; Submarine Illumination; New Glass Cement; Substitute for Gunpowder in Coal Mines; etc.....	338
CORRESPONDENCE.—San Diego Mines; Northern Quicksilver Mines; Keeping Fruit; Items in Brief, etc.....	339
MINING SUMMARY.—Stock & Exchange Board; Market Report.....	340-1
Gravel Hills of Placerville; Water Pressure; A Card Holder—Ill.; Sugar from Grapes; Ex- tension of Patent Refused; California Au- tumn Tinted Leaves; etc.....	342
USEFUL INFORMATION.—Position and Motion; Drying-oil Substitute; How a Person Feels at the Instant of a Railroad Collision; Etc.; Good HEALTH.—How to Secure Long Life; Don't Rock the Cradle; etc.....	343
Mining Accidents; Recent Mining Discoveries; English Capital in Pacific Coast Mines; Hints to Miners.....	344
Iron Smelting Under Artificial Blast—Ill.; Talpey's Hand Sawmill—Ill.; Affairs in Ari- zona; Our Mining Interests Abroad.....	345
DOMESTIC ECONOMY; DOMESTIC RECEIPTS; ME- CHANICAL HINTS; LIFE THOUGHTS.....	346

### Mining Accidents.

On November 23d, a miner named Wm  
H. Hampton, had both ankles broken and  
the ribs of the right side crushed in, by a  
cave in the Eureka mine, at Grass Valley.

Giovanni Quirolo was killed in the Paugh  
mine, near Clinton, Amador county, on the  
18th.

Thomas Bodkelin, of Nevada, died at  
Bradshaw, from injuries received in the  
Tiger mine.

On Monday last, a miner employed in  
the Ohio mine, in Little Cottonwood  
Cañon, Utah, was carried away by a snow  
slide, and perished.

### Recent Mining Discoveries.

A rich gold-bearing quartz vein was re-  
cently discovered near Quartzburg, Mari-  
posa county.

New silver mines have been found in  
Arizona, near Prescott and in the Pinal  
Mountains.

Rich cinnabar leads have been struck in  
San Luis Obispo county, near the town of  
Cambria.

A rich silver ledge has been discovered  
near Astoria. Thirteen claims have been  
located and the excitement in that neigh-  
borhood is high.

WE have received the Eighteenth An-  
nual Report of the Superintendent of  
common schools for the department of the  
City and County of San Francisco, for the  
school year ending June 30, 1871.

ON FILE.—Argenta District, Montana;  
Notes from Montana; San Diego Mines;  
Letter from J. P., concerning Ward  
Becher and North Aurora mines.

## English Capital in the Pacific Coast Mines.

The recent introduction of English cap-  
ital into the mining enterprises of the  
Pacific States and Territories, will give a  
new and decided stimulus to this branch  
of industry, and afford means to thoroughly  
develop properties heretofore worked upon  
a limited scale. Although, as yet, invest-  
ments have been confined chiefly or ex-  
clusively to mines already developed, it is  
quite likely that ere long they will be ex-  
tended to undeveloped mines, when the  
fact is realized that by so doing they will  
be able to make terms more favorable to  
their interests. It is now some fifteen  
years since the English turned their backs  
upon California as a field for profitable in-  
vestment, but since then a great change  
has taken place. The cost of labor, of  
machinery, and of almost every appliance  
for mining, has been materially lessened,  
while the problem of increase of pay with  
depth in our quartz mines has been solved  
satisfactorily. The railroad affords facilities  
for visiting and examining into the mer-  
its of our resources, while by the use of  
the telegraph the superintendents are en-  
abled to communicate quickly with head-  
quarters and remove all "red-tape" diffi-  
culties.

The whole coast presents an unparal-  
leled field for the profitable employment of  
capital. We have plenty of raw material;  
all we want is skilled, intelligent labor,  
combined with capital, to make it avail-  
able. The question, Will American mining  
pay? has absorbed much attention, and  
been ably discussed, *pro* and *con*, through  
the columns of the English mining jour-  
nals, some of which have their regular  
correspondents here; while their editor-  
ials upon the affairs of the Pacific Coast  
would do credit to our own papers.

The caution which English capitalists  
exercise in the examination of mines, is  
well calculated to prevent the sale of worth-  
less or unproductive properties. Compet-  
ent mining engineers are almost invari-  
ably sent out to make thorough investiga-  
tions, and, upon their reports, a sale is  
consummated or the negotiation aban-  
doned. In some instances two or three  
experts have been required to make re-  
ports upon the same mine, before informa-  
tion was gleaned that was satisfactory to  
the intending purchasers. This caution is  
in every way commendable, and is a safe-  
guard both to the investors and the owners  
of good mines, and a matter which many  
of our capitalists might profit by.

There are many good mines west of the  
Rocky mountains, which, by enlarging  
their works and developing further, might  
be made to pay handsomely, but which,  
from the scarcity of capital and the high  
rates of interest here, are unable to make  
the requisite improvements, but which in  
European cities, where there is often a  
plethora of money, and a less rate of inter-  
est prevails, would be the best investment  
that could be presented to the notice of  
capitalists.

A number of mines of this character  
have been purchased in London during  
the past year, many of which are now pay-  
ing handsome dividends, and the shares of  
the companies have, in consequence, ac-  
cording to the English papers, taken an  
advance, some of them being considerably  
above par. This result is calculated to  
increase the confidence already manifest-  
ing itself in that country, in the richness,  
extent and permanence of gold and silver  
mines on the Pacific slope, and is opening  
up a new field for safe and profitable in-  
vestment. There can be no doubt that our  
mines, when worked intelligently and ju-  
diciously, promise larger returns than  
almost any other branch of industry; and  
there is no reason why, with proper man-  
agement, they should not pay monthly  
high rates of interest upon foreign capital  
expended in their development.

It is to be hoped that English investors

will continue to exercise their habitual  
caution in the selection of mining prop-  
erties presented to their notice, thereby giv-  
ing some of us a lesson, and protecting  
their own interests, as well as affording  
means for working many good and valu-  
able mines, which are in need of capital, in  
order to be made paying institutions.

### HINTS TO MINERS.—NO. 1.

In the great mineral belts of the Pacific  
slope there are, no doubt, nestled in the  
rocks which gave them birth, untold mil-  
lions, which only await this energy and  
perseverance of this and future generations  
of miners, that they may be poured, like  
the shower of Danaë, into the lap of civili-  
zation.

Though many have become somewhat  
discouraged at the gradual decrease in the  
extent of the superficial deposits of aurif-  
erous gravel, which have yielded so many  
millions of dollars, and which have given  
our State such an enviable and world-wide  
reputation, the constant increase of quartz  
mining in this State, and the recent ex-  
tensive discoveries of valuable ores in  
Utah, Nevada, Montana, etc., have given  
the business of mining an impetus that  
will be felt for years to come; and the  
mining interest generally, instead of  
being on the wane, as many had begun to  
fear was the case, is now increasing in im-  
portance, and bids fair to exceed almost  
every other branch of industry on this  
coast.

Hence the prospector's occupation is  
not yet gone! He still has a vast area of  
undeveloped territory, over which to make  
his nomadic researches; and the early  
Californian, the pioneer of '49, as well  
as many who came to this coast in later  
days, yet possess the miner's characteristic  
trait of a desire to wander from place to  
place, in hopes of "striking it rich" and  
making their fortune suddenly.

Many, now, as formerly, come to Cali-  
fornia under the supposition that all they  
have to do, is to take a pick and shovel, go  
into the mountains with a few provisions  
for a week or so, and return with their  
fortunes. This is as far from being gen-  
erally the case now-a-days, as it was then;  
while the lucky ones are quite as numer-  
ous now as in '49 and '50.

And now, as prospecting is still the order  
of the day, we propose to offer, from week  
to week, a few hints under the above head,  
which will embrace brief allusions to geol-  
ogy, mineralogy and metallurgy, espe-  
cially the latter.

As a newspaper is no place for lengthy  
discussions on any subject, those who de-  
sire a thorough knowledge on any par-  
ticular point, will have recourse to stand-  
ard text books, or works devoted especially  
to the subjects on which full information  
is desired. But to the prospectors and  
miners, especially in remote localities,  
where such hooks are not to be had, even  
a little information is useful, and, it is  
to be hoped, will be acceptable.

#### What Constitutes a Mine?

Among the many things which should  
be understood by the prospector and miner,  
the first, perhaps, is, what constitutes a  
mine? Not many years ago, the answer to  
this query would have been—a pocket  
specimen, perhaps, covered with free gold,  
or showing very evident traces of "eblo-  
ride;" a counterpart, so-called, of many  
others from the same vein, which was said  
to be a marvel of richness by somebody—  
an assayer, perhaps, or an "experienced  
miner." A still shorter time since, it was  
a working test—a little larger quantity—  
this time a skin full from La Paz or Mex-  
ico, or a bag full from the interior, hur-  
ried through the fire with expeditious  
fluxes—worth more, proportionately, than  
could be realized from the ore, and too  
costly for practical use. It had then  
yielded so much by "working process." The  
recollections of such bags and skins  
on the corners of Montgomery street, and

in front of brokers' offices, are, no doubt,  
familiar to many of our readers, and, per-  
haps, to their cost.

Many of the mines which they repre-  
sented never had any "local habitation,"  
except in the imaginations of the deluded  
buyers; all they required was a name.  
These days are now gone by, never to re-  
turn. The capitaliste are no longer to be  
caught with chaff; experienced metallurg-  
ists and mining engineers are too plenty  
for that.

In order to answer the above question  
properly, we should take into considera-  
tion the general classification of mineral  
deposits, and as Mr. Raymond's last report  
contains a chapter on that subject, we can  
perhaps do no better than to reproduce it  
here, especially since the meagreness of  
the appropriation for preparing and pub-  
lishing the report was such as to afford  
very little for printing purposes, whereby  
the book is somewhat scarce. Mr. Ray-  
mond says:

"Mineral deposits," are classified ac-  
cording to their form, position and proba-  
ble origin. The first general distinction  
is made between exposed or superficial,  
and enclosed or subterranean deposits.  
Superficial deposits comprise deposits of  
debris (alluvial or drift deposits formed of  
the accumulated fragments of older rocks,  
such as gold and tin placers, gravel and  
cement mines, etc.) and surface deposits  
*in situ* (such as bog-iron ores, peat more,  
salt, soda, and saltpetre beds and the coast  
deposits of amber). Occasionally a de-  
posit originally enclosed is exposed by  
erosion of the overlying rocks, as, for in-  
stance, the vein of the Red Mountain Co.  
at Silver Peak, Nevada, which is a fissure  
vein from which the hanging wall forming  
the side of the mountain has been almost  
entirely carried away by disintegration and  
aqueous action.

As this scarcely justifies us in calling  
such a deposit a superficial one, so, on the  
other hand, a few feet of overlying soil  
does not convert a superficial deposit into  
an enclosed one. The distinction, like  
others to be hereafter mentioned, is broad  
and convenient, but not minutely accurate.  
Enclosed, or subterranean, deposits comprise  
three great classes, distinguished according  
to their form, as tabular or sheet deposits,  
mass deposits, and irregular segregatione  
or aggregations. I must repeat that these  
distinctions are not sharply drawn, and at  
all times to be recognized in practice.  
Under sheet deposits are ranked such as  
possess two predominant dimensions, while  
the third called the thickness, is compara-  
tively small, so that we may speak of them  
as having a general plane or sheet. It is  
also understood that the surfaces bounding  
such a deposit in two sides have a general,  
though not mathematically exact, parallel-  
ism; they constitute its walls or its roof  
and floor, according to its position. The  
deposits of this class are divided, according  
to their nature, into lodes or veins and  
beds.

Mass deposits include both large irregu-  
lar masses of valuable minerals and strata  
of rock impregnated with valuable min-  
eral, or so intersected with a network of  
mineral veins that the whole must be ex-  
tracted. The German word *stockwerk*, ap-  
plied to this class, and adopted by some  
American writers, means literally, story,  
or story work, and refers to the manner in  
which masses are exploited in successive  
stories, like those of a building.

Irregular segregations or aggregations  
include nests, chambers, pockets, amyg-  
dules, and small ore bodies of every de-  
scription. They may occur in larger de-  
posits of other classes. Thus the amyg-  
daloid beds of Lake Superior are  
sheet deposits, but their copper is often in  
segregations. Pockets and chambers are  
also common in veins, especially in large  
ones. The ordinary rock formations, worked  
by quarrying, and the springs worked by  
horng, digging wells and pumping are  
not taken into consideration.

### Notes on Contributions to Our Cabinet.

No. 548.—Mr. Virgin of Little Cotton-  
wood, has presented us with a fine speci-  
men of "peacock ore" from the Copperopol-  
is lode, head of Little Cottonwood  
Cañon, U. T. The lode is about nine feet  
wide. It carries from 45 to 68 per cent.  
of copper and from \$32 to \$68 per ton in  
silver. The specimen received is a hand-  
some one.

## Iron Smelting Under Artificial Blast.

In the future mining of the vast interior of this country, it will be frequently advantageous to smelt iron for supplying the local iron foundries of large mining districts, and sometimes for the more economical working of large and lasting mines, which may then have the heavier wearing parts of their machinery substituted when required, to save the heavy costs for transportation. The opening of various iron manufactories on this coast will assist the mining of that metal, and, in fact, several new companies are already projected. The Oregon Iron Works were the first to produce pigs—making good iron.

The accompanying cut from Mr. Phillips's new work, "The Explorers', Miners', and Metallurgists' Companion," represents a section of the most common and convenient furnace for smelting the various available ores.

"A strong, square bed of stone is first laid, of about twenty feet in diameter; the center should be a good fire-rock, and drainage channels should be left beneath, to pass off any moisture.

The furnace is drawn to shape; the total height may be fifty feet; the greatest internal diameter at the bottom of the upper cone, sixteen feet; and the diameter of the underlying square crucible, three feet at the blast-holes.

The properly shaped fire-stone, *F*, should be placed to form the front of the crucible, with the stones for the sides and back as high as the blast-holes, which generally stand about from two feet to two feet six inches from the bottom. The crucible part, *S*, is then reared up as shown, and flared outwards to form the bosh, *c, c*; this is at the same time surrounded by the adjoining shell and full-sized outer wall, which is built of strong material, and brought to a dead level at this particular height to form the bed for the upper cones or double shafts; whilst four channels or doorways are left in its lower part (for front tapping-hole, where the furnace-man is seen with the tapping-har), for the two side blast pipes and the back blast pipe (as shown with its governor at *B*).

The arched gangway, *G*, is made to pass a little more than half round the back of the furnace, to provide room for the blast pipes and the workmen.

Upon this strong, square prism of bed-work the two circular cones, *C*, are built, the one being a few inches larger than the other, so that sand may be placed between, to permit expansion and contraction of the inner cone, and to allow greater facility during repairs.

At the top of this is seen a walled terrace and railway for supplying the furnace, which explains itself at sight. Such furnaces may be worked more conveniently when placed at the foot of a hill, as the road can be made to run at a more convenient level for supplying the furnace.

For the last few years, hot blast has been used, which reduces faster and much cheaper, although the iron is not of such good quality. The air is forced through chambers or pipes, where it is warmed to about 600° by the wasted heat from the furnace, or by a separate fire. It is said, that in Scotland alone, two million of tons are saved every year, by this simple means.

There is another very important advantage gained by the use of hot blast, which is that ordinary coal may be used, as well as coke and charcoal. About 6,000 cubic feet of air is forced into one of these furnaces per minute, which is four times the weight of ore; so that the difference of temperature is enormously favorable for ease, speed and economy. As to the quality of iron, it may be more owing to the use of coal that contains sulphur, phosphorus, etc., instead of coke or charcoal, than to the hot or cold blasts."

We have received from the publishers, through Roman & Co., No. 11 Montgomery street, "The Federal Government," by R. H. Gillett.

## Talpey's Hand Sawmill.

These mills are a great convenience to carpenters and builders as they can be set up and run in any ordinary shop or easily transported to any building in course of construction. The jig saw will do any kind of scrolling required in ordinary work. It is worked by the foot, as may be seen by the treadle as shown in the cut. A balance-wheel, not shown, may be attached to the shaft operating the jig saw. The circular saw is worked by a crank. Horse

TALPEY'S HAND SAWMILL.

or other motive power may be readily attached, when required, by means of belting on the fly or balance-wheel. The feeder may be raised or lowered at will by means of the gearing shown on the front side of the machine, so as to suit itself to

CUPOLA FURNACE.

the size of the lumher. It feeds itself through the action of a small toothed wheel, which revolves and draws the boards or other material toward the saw.

The object said to be attained, and we believe it has been, by the inventor, is a simple machine with self-feeding device, not difficult to operate or very expensive. It is said to be popular wherever used in the Eastern States, and orders are freely received by the New York manufacturers for the Southern and Western States. For builders in interior towns, where no wood-working shops exist, we should think that this machine would prove indispensable.

It is very simple and durable in construction, and has been recently introduced into our State. One man can operate it easily, doing the work of several hands.

This machine is for sale by W. I. Tustin, and can be seen in operation at his shop on the southeast corner of Market and Beale streets in this city.

## Affairs in Arizona.

Our friends in Arizona have had a great deal of trouble concerning the Indian af-

## Our Mining Interests Abroad.

It may be interesting, not only to those whose interests are mentioned, but to all who care for the reputation and progress of our mines, to know that the letters of our traveling correspondent, Mr. W. H. Murray, are being reproduced by the *London Mining Journal*—the leading mining paper of the world. Our friends furnish us in various ways valuable information, which it is our province to scatter broadcast over the land for the benefit of all whom it may concern, and especially for the furtherance of our mining interests abroad. We are always glad to receive such favors, as it builds up the interests we especially advocate, and thus helps us by helping those whose interests are connected with ours. Our MINING SUMMARY, which costs us much labor, more than any other journal is willing to expend on such subjects, is liberally quoted by all the principal mining journals of our own and foreign countries, increasing the notoriety of our mines throughout the world. Some of our local dailies copy our summary entirely, but it matters little whether they give us credit or not so long as it is for the benefit of those in whose interests we are laboring. We are always pleased to receive any communications on subjects connected with the object of our paper, and heartily encourage our friends in the mining districts to write us, occasionally, and furnish us whatever may be new and of interest in their particular localities. The SCIENTIFIC PRESS is the only journal on the coast which is especially devoted to mining affairs, and we have spared no pains or expense to make its statements on such points full and reliable. The republication of the letters

above mentioned shows that the *Mining Journal* evinces a due appreciation of our efforts in this particular. Miners, write for your paper.

**NEW DISTRICT.**—A mining district has been lately organized, which is situated in the West Diamond range of mountains, 28 miles due north of Eureka, Nevada, and about one mile west of the stage road to Palisade. The general indications and prospects are of the most promising character. The district is eligibly situated for cheap and convenient working, and wood and water are abundant in the surrounding hills. A town site is now being laid out. The district is called after its discover, Mr. McGary.

**POPULAR LECTURES.**—The second course of lectures before the College of Mechanics' Arts will begin on the 9th of December next, and those desiring to attend should make application at once at the Library of the Mechanics' Institute, No. 27 Post street. The first course of lectures, which were reported fully in the SCIENTIFIC PRESS, attracted much attention and were very interesting. We will endeavor to give liberal reports of the forthcoming ones, for the benefit of non-residents, and those who are unable to attend.

**THE RAIN.**—The heavy rains that have been falling for the past few days will, no doubt, furnish the long-looked-for supply of water necessary for the working of the mines and mills of the State. It is a good forerunner of the amount to follow, and we may shortly expect to hear of an increased yield of hulkion from all quarters.

**LUNAR RAINBOWS.**—On Sunday and Monday evenings most perfect and beautiful lunar rainbows were visible to those who happened to be out of doors at the time. As perfect rainbows as these were, are by no means of common occurrence in this section of the country.

The inventor of the metallic baggage check realized \$250,000 out of it.

## DOMESTIC ECONOMY.

### Farmers' Clubs and Farmers' Wives.

The reading of essays by the ladies is one of the exercises which give life and interest to the meetings of the Springfield (Vt.) Farmers' Club. From one of the essays, by Mrs. Daniel Rice, published in the *Vermont Farmer*, we copy the following paragraph:

Did you ever think of the amount of thought requisite to plan three meals a day for three hundred and sixty-five days in succession? To prepare enough and not too much, and for those living at a distance from the village, to remember that the stock of flour, sugar, tea, etc., is replenished in due time?—Do you ever think of the multitude of her cares and duties! She must rise early to prepare breakfast or oversee it.

Perhaps there are children to wash, dress and feed, or to get ready for school with their dinners. There is baking, sweeping, dusting, making beds, lunch for the men, may be—dinner, supper to be made ready at the proper time—the washing, starching, folding and ironing of clothes—the care of milk, including the making of butter and cheese—and the inevitable washing of dishes.

In autumn there is an additional work of pickling, preserving, canning of fruit, drying apples, holling cider, making apple sauce, with the still more unpleasant task which falls to her lot in hutchering-time. Then there is haying, harvesting, sheep-shearing, etc., when more help is needed, bringing an increase of her labors.

Twice a year comes house-cleaning. By the way, of all the foes a house-keeper has to contend with, dirt is the greatest. She may gain a complete victory, and think to repose upon her laurels after her semi-annual engagements—but it is only temporary. The enemy soon returns, and even daily skirmishing does not keep it at bay. There is the mending, too. Sewing machines are great blessings, but they can't set in a patch or darn the stockings.

I don't mention these things by way of complaining of woman's lot in general, or asking for her any rights which she does not possess. I don't know as there is any remedy in the present state of the world. It seems to be one of the evils of life, which must be borne as we bear other ills—but what I do ask is a due appreciation of the important part that woman acts, and a concession that her labors, mental and physical, are as great, all things considered, as those of the other sex. Women are not so childish that a little sympathy now and then, or acknowledgment of their efforts and sacrifices, make them imagine their case worse than it is. I tell you, men and husbands, "it doeth good like a medicine," and many a poor, crushed, broken-down wife and mother is dying for want of it.

**BUCKWHEAT CAKES** make an excellent dish for breakfast on a cold morning. The chemical constituents of this grain are such as to afford more animal heat than any other cereal. To make them nice, the following is perhaps the best receipt which can be given: Have ready two cups; put one teaspoonful of tartaric acid in one cup, one teaspoonful of soda in the other cup; add to each about two tablespoonfuls of cold water; stir it well. Make one quart of huckwheat meal into a thick batter, with moderately warm water; add the contents of one of the cups; stir it well, then pour in the contents of the other cup; stir that well also; add to the whole one tablespoonful of melted butter, and bake on a griddle nicely cleaned and greased with good lard. The batter is ready for use as soon as mixed.

Many people think that three parts of huckwheat and one part of the best heavy oats make much better flour for cakes than huckwheat alone. The oats make the cakes light and spongy, and easy of digestion.

**KEEPING FISH FRESH WITH SUGAR.**—A method adopted in Portugal for preserving and keeping fish fresh, consists in first removing the viscera, then sprinkling sugar over the interior, and keeping the fish in a horizontal position, so that the sugar may penetrate to the greatest possible extent. It is said that fish prepared in this way can be kept completely fresh for a long time—the savor being as perfect as if recently caught. Salmon thus treated before salting and smoking, possess a much more agreeable taste. A tablespoonful of sugar is said to be sufficient for a five-pound fish.

**DRIED apples**, when they have been made of good fruit and carefully prepared, are very nice, really much richer, when gently stewed till perfectly tender, than the fresh fruit. Down in the country of peaches, I have seen them greatly preferred to dried peaches, though made of apples quite inferior to our best. They make good puddings, with sago and tapioca, as well as with bread, lemon and Zante currants.

For stewed sauce, a fine variety can be obtained by putting with them quinces, green grapes and rhubarb, either canned or fresh, and lemon pulp; and some use prunes, raisins and other fruits, both domestic and foreign. Sweet dried apples, usually so hard to dispose of, go off briskly when stewed with cranberries, rhubarb and other sour articles, when nice dried apples can be had.

We hope some of our readers who have been accustomed, often, to go without any fruit at their meals, because they despise "dried apples," will carefully try some of these recipes.

**KEEPING TIN WARE BRIGHT.**—It is a very good plan every washing day, before the hot suds are thrown out, to gather up the tin ware that is in daily use and wash it well with a woolen cloth in the tub or hoiler. The brightness thus given to it is nicer than from scouring; besides, the ware is not worn out, and the seams, about the handles and spouts can be made very clean. With careful usage, tin and britannia ware need not wear out or fall into disuse, hardly in one's life time. All such ware should be made dry about the kitchen stove before it is put away.

Iron, or sheet iron ware, should be kept in good, presentable condition by stove blacking. There is no need of gray or dingy pots and tea kettles when they are so easily kept neat and in good order.

The tin wash hoiler should always be washed and wiped and dried before putting away.—*Rural New Yorker*.

**THE USE OF GLYCERINE IN CANNING.**—We find the following in an exchange:—"Cans in which corn has been placed, sometimes burst in consequence of the fermentation of the contents. The use of pure glycerine will prevent this fermentation. It has only a faint, sweetish taste, not perceptible at all mixed in small quantities with other substances, and is not unhealthy, like many other anti-fermenting ingredients."

Corn which has been properly canned is no more likely to ferment than any other fruit, but the use of glycerine as a preventive to fermentation is new to us; although we are well aware that the glycerine itself will undergo no change. How much glycerine should be used to prevent fermentation, and how far may we depend on that substance. We should be pleased to have the experience of any one who has or may hereafter try it.

**BROILED LIVER.**—Liver can be prepared for the table in an excellent manner by broiling; many prefer it to frying. Broil about ten minutes, with a few slices of salt pork, then season with pepper and salt, and cut up into small strips with the pork; stew a few minutes with a little water and flour sufficient to thicken the gravy. Cut in thin slices for broiling or frying, and if tough soak it in cold salt and water for about a quarter of an hour previous to cooking it. When broiled it is nice minced fine and seasoned with salt, pepper and butter.

**A TENDER GOOSE OR DUCK** may be determined by raising the wing; if the skin tears easily the fowl is tender. If you can easily insert the head of a pin into the flesh of a goose or duck, it is tender and young. The strength of the joints of the legs and the coarseness of the skin is generally a good guide in buying a goose or duck. Such a test is more less applicable to all other fowls.

**REMOVING GREASE SPOTS.**—In removing grease spots from fabrics by means of benzine and petroleum, it often happens that a colored or stained outline of the portion moistened is left. This can be prevented by the application of a layer of gypsum, extending a little beyond the moistened region. When dry, the powder is to be shaken or brushed off, when no traces of the spot will remain.

**AUSTRALIAN COOKED MEATS** are sold in London at from 2½ to 3 cents—American currency—per lb. in cans, comprising boiled and stewed beef and mutton, and corned and spiced beef. It is pronounced rich, succulent and superior to any English meat, besides being cheaper.

### Mechanical Hints.

**TO BLEACH SHELLAC.**—Dissolve in an iron kettle one part of pearl ash in eight parts of water; add one part of pulverized shellac or seed lac, and heat the whole to ebullition. When the lac is dissolved, cool the solution and impregnate it with "chlorine" till the lac is all precipitated. This precipitate is white, but the color is deepened by washing and consolidation. Dissolve in alcohol. Lac bleached by this process yields a varnish as clear as copal.

**LINSEED OIL.**—Linseed oil is made from the seed of the flax plant (formerly called lint-seed,) by grinding them in a mill, and pressing the powder by hydraulic or other power. When first pressed it is of a golden yellow color, but soon collects impurities from the air, and turns brown. The impurities can be washed out by stirring water into it thoroughly, and leaving the water to settle. It contains no stearine, and hence does not congeal at low temperatures. Its chief use is in decorative and preservative painting. Being mixed with the powdered colors, and spread on wood, stone or iron with a brush, it soon dries and hardens into a coating which acts as cement, varnish, and shield from weather. To quicken its drying, it is boiled before using. It is sometimes used in medicine as a laxative, and for this purpose is made from the raw seed without roasting. It is quite an important article of commerce.

**PROTECTING IRON.**—Prof. F. Grace Calvert, of England, has discovered that the carbonates of potash and soda possess the same property of protecting iron and steel from rust as do those alkalis in a caustic state. If an iron blade is half immersed in a solution of either of the above named carbonates, it exerts so protective an action that that portion of the iron which is exposed to the influence of the damp atmospheric air does not oxidize, even after a period of two years. Similar results have been obtained with sea water, to which have been added the carbonate of potash and soda. The applications of this fact are numerous and important.

### The Value of Reading.

No matter how obscure the position in life of an individual, if he can read, he may at will put himself in the best society the world has ever seen. He may sit down with the good and great men of antiquity. He may converse with Franklin and Washington; with all the writers in prose and poetry. He may learn how to live, how to avoid the errors of his predecessors, and to secure blessings, present and future, to himself. He may reside in a desert far away from the habitations of man; in solitude, where no human eye looks upon him with affection or interest; where no human voice cheers him with the animating tones; if he has books to read, he need never be alone. He may choose his company and the subject of conversation, and thus become contented and happy, intelligent, wise and good. He thus elevates his rank in the world, and becomes independent in the best sense of the term. Reading, then, stands among the first in importance of the departments of school education.

**EARN WHAT YOU SPEND.**—Three-fourths of the difficulties and miseries of men come from the fact that most want wealth without earning it, fame without deserving it, popularity without temperance, respect without virtue, and happiness without holiness. The man who wants the best things, and is willing to pay just what they are worth, by honest effort and hard self-denial, will have no difficulty in getting what he wants at last. It is the men who want goods on credit that are snubbed and disappointed and overwhelmed in the end. Happiness cannot be bought by the hittle, nor caught up by the excursion train, nor put on with any robe or jewels, nor eaten at any feast. It does not exist in any exhilaration, excitement or ownership, but comes from the use of the faculties of the body and mind.

**CLEANSING THE HAIR.**—The best substance with which to cleanse the hair is a tablespoonful or two of common spirits of ammonia in a basin of water. The scalp and hair should be thoroughly washed and rinsed and wiped dry. A little glycerine dissolved in alcohol may then be advantageously applied; all other oils will become stale, and are unfit for such use. Barbers commonly use carbonate of potash in the water they employ for shampooing; but spirits of ammonia is better.

**CHEERFULNESS** is a Christian duty incumbent on all.

Will be Ready for Sale November 13, 1871.  
**A NEW MINING BOOK.**

The most Complete ever Written for the Pacific States.

**The Explorers', Miners'—AND—Metallurgists' Companion,**  
Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

BY J. S. PHILLIPS, M. E.

Just Issued by DEWEY & CO., Publishers Scientific Press, S. F.

(Printed and published only on the Pacific Coast.)

Contains 640 pages, illustrated with some 80 engravings.

A Profitable Instructor for Prospectors, Miners and Metallurgists throughout the world.

Treating on the following subjects:

Geological Formations of the Primitive Earth, i Secondary Rocks, its Mineral Veins, Minerals, Metals, Coal Fields, Etc., Etc.  
General Composition and Peculiarities of Mineral Veins Their Comportment with Each Other, and with Cross Courses, Dikes, and Slides.  
Geological Characteristics of the Most Extensive Mining Districts.  
Exploration for, and Examination of, Mineral Veins. Discrimination and Assay of Minerals, by the Most Available and Practical Methods.  
Mining and Mechanical Engineering, Above and Below the Surface, for Dressing of Ores, Deep Mining, Etc. Assorting, Crushing, and Concentration of Ores.  
The Best Methods for Reducing the Minerals and Metals to a Marketable Condition, by Roasting, Milling, Chlorinizing, Smelting, and by Chemical Treatment.  
The Continually Recurring, Unnecessary Errors, in Mining and Metallurgy.

PRICE, bound in cloth, \$10 (in coin or its equivalent). In leather, \$12. Postage, 50 cents extra. Address all orders (wholesale or retail) to DEWEY & CO., Scientific Press, 333 Montgomery street, San Francisco.

### LUBRICATING OIL,

#### THE BEST IN THE WORLD!

The attention of the public is called to GRUBER'S NEW PATENT LUBRICATING OIL. For running Machinery of all kinds it has no equal. It will not gum, and runs perfectly smooth, cool and clean. This OIL offers special inducements to Farmers, Livery Stable Keepers, etc.

#### It will be found far Superior

To any other Oil or Grease now in use, for Carriages, Wagons, and all kinds of Farming Machinery.

Mill-men, Printers, and all others having occasion to use a Lubricator, will find a decided advantage in using this Oil—one gallon being equal to two of the best Oil in the market.

#### Perfect Satisfaction Guaranteed OR MONEY REFUNDED.

Orders per Mail or Express will receive prompt attention.

Office and Salesroom—  
**GRUBER LUBRICATING OIL CO.,**

## STEPHENS &amp; CO.,

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.  
It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.

The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.  
In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.

By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form. "Scientific  
American."

Price by mail, prepaid, \$4. For agents' terms, address  
**STEPHENS & CO.,**  
Riverton, Conn.

## A New Reclamation Enterprise.

It is well known to all who are conversant with the natural resources of California, that in the valleys and river bottoms there are hundreds of thousands of acres of valuable land subject to overflow, which, if redeemed, would be the most fertile soil in the State. To accomplish this result requires a large outlay of capital, in the building of levees, dykes and other necessary improvements. In Holland, miles of territory are protected from the encroachments of the sea by artificial means, and are drained by a system of dykes, which extend like a network all over the country; and the soil, thus redeemed, is invariably more prolific than any other.

We learn that J. Ross Browne, while in London some months ago, presented this subject of reclaiming swamp and overflowed lands in California, to a number of English gentlemen who are largely interested in such enterprises, and a "Syndicate" was formed for the purpose of engaging capitalists to furnish the requisite means to carry through such an undertaking in this State. A few days since a party consisting of Hon. E. B. Eastwick, M. P., J. F. Dalrymple Hay, Esq., Engineer, etc., and W. S. Campbell, arrived here for the purpose of making an examination of the resources and value of overflowed lands. These gentlemen have made a thorough investigation of lands in Sacramento and San Joaquin valleys and in the vicinity of San Francisco Bay. The examination is reported as very satisfactory, and the result will probably be the introduction of a large amount of English capital for this purpose. All of the party except Mr. Campbell will return to England at once, to make their report. Mr. Campbell, who was lately American Consul in Holland, and a resident of that country for eighteen years, is thoroughly familiar with the system of dykes, which guard its lands from the sea, and he brings to this enterprise valuable experience, gained from years of personal observation.

We look upon this undertaking as one of the most important ever commenced in California, profitable alike to the people of the State at large and the capitalists who invest in it. The great need for the development of our resources is money, which cannot be obtained here at low rates of interest, and a fine field is offered for the outlay of foreign capital, which will meet with a return many fold greater than could be derived from an investment in the old and settled countries of Europe. We hope to see this enterprise become a success to its full extent, as it will contribute to the prosperity of the State, and be the means of securing the further introduction of foreign capital, which is always awaiting investment, where safe and permanent profits are assured.

We know that all well directed capital invested in our lands will eventually extend its influence towards the development of our rich mines.

PUBLIC SPEAKERS AND SINGERS WILL FIND "BROWN'S BRONCHIAL TROCHES" beneficial in clearing the voice before speaking or singing, and relieving the throat after any unusual exertion of the vocal organs, having a peculiar adaption to affections which disturb the organs of speech. For coughs and colds the TROCHES are effectual.

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. s9b9tft

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 25v12mbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 291 Bowery, 157 E. 26th, 477 9th Ave. New York Good work at high prices if desired. 25v12mbp

## Good Cause for Thanksgiving.

Few communities has had greater cause for thanksgiving than have the people of California during the past week; and we doubt not that most hearty and devout thanks went up to the Giver of All Good on Thursday last, for the welcome foretaste of a prosperous season, which the bounteous rains of Sunday, Monday and Tuesday brought to our needful doors. By the delay of the November rains to near the very close of the month, a feeling of doubt and distrust had begun to find its way into the minds of our people, which has now, happily, given place to most cheerful views of the industrial and business prospects of the coming season.

We have now received fully the allotted amount of rain—about four inches—due, at the present time, to secure more than an average crop, and our farmers will lose no time in preparing their ground and getting in the seed. The experience of the past few years is a valuable addition to the stock of knowledge needed by California farmers. They have learned that drouths are an exception to the general value, and even they are not so much to be dreaded as formerly;—for, by proper attention, except in a few localities, fair crops can even then be raised, save in the most extraordinary seasons.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. f25-1y

N. Seibert's Eureka Lubricators for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3v

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

**TARRANT'S SELTZER**  
APERIENT

The King of Mineral Springs is the German Seltzer, and Tarrant's Effervescent Seltzer Aperient is its duplicate. Letters attesting its wonderful Tonic Aperient and Anti-Bilious qualities swarm in from every source. The question has been settled whether artificial medicated waters may not be equal to those which burst sparkling from the earth itself. They can, and the Seltzer Aperient, when undoubtedly pure and genuine, proves the fact. Be cautious. Accept none other.

**TARRANT'S SELTZER**  
APERIENT

SOLD BY ALL DRUGGISTS.

**TARRANT'S SELTZER**  
APERIENT

are being infringed by importation of Capsules made in contravention of his rights, which necessarily are numerous, BETTS being the original inventor and Sole Maker in the United Kingdom.

1, WHARF ROAD, CITY ROAD, LONDON, AND BORDEAUX, FRANCE.

**CAST STEEL FILES.**

John T. Bunker & Co.'s—We wish to inform Dealers and Iron Workers that we are Agents for these celebrated Files, and are offering superior inducements to introduce them. (22-v23-3m) HOOKER & CO.

**Wanted.**

Situation Wanted by a Practical Engineer, a Mach. mist, capable of keeping Machinery in order. Good references. Address B, B, B, this office. de2-1t

## AUCTION SALE.

We will sell at public Auction, to the highest bidder, for U. S. gold coin, on THURSDAY, December 28th, 1871, at W. A. Holcombe & Co.'s warehouse, the following described goods, to pay storage and advances, unless the charges are previously paid. Sale to commence at 12 M.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

**Altona Gravel Mining Company—Location**  
of works, Grass Valley, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of October, 1871, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office in San Francisco. Any stock upon which said assessment shall remain unpaid on the 4th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale as public auction, and unless payment shall be made before, will be sold on Tuesday, the 26th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
DAVID WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal.  
nov4-5w

**Eagle Quicksilver Mining Company—Location**  
of works, Santa Barbara County, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of October, 1871, an assessment of Forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Thursday, January 4th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal.  
nov1d

**Mina Rica Mining Company—Location**  
of works, Auburn District, Placer County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of November, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, room No. 2, 4th California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, the 18th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
GEO. R. SPINNEY, Secretary.  
Office, Room No. 2, third floor, 4th California street, San Francisco, California  
nov18-5w

**Nevada Land and Mining Company—Location**  
of works, Spruce Mountain, Antelope, Clifton and Johnson and Latham District, Elko County, State of Nevada.  
NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 9) levied on the 12th day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:  
Names. No. Certificate. No. Shares. Am't.  
Joseph Klopentine, unissued 2000 \$80 00  
And in accordance with law, and an order of the Board of Trustees, made on the 12th day of October, 1871, on many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, Cal., on the 4th day of December, 1871, at the hour of 2 o'clock p. m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal.  
nov18-31

KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.  
Yours truly,  
A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, OREGON, April 22, 1871.

Mn. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.  
Yours respectfully,  
G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.  
Yours very truly,  
C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

Messrs. KNOWLES & SIBLEY, 92 Liberty street, New York—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.  
Yours very truly  
GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.  
Yours very respectfully,  
WM. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDACQUA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which I say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.  
Respectfully yours, etc.,  
EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELLERTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.  
Yours very respectfully,  
G. W. WHITAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyl., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.  
Yours very truly,  
P. SAULT, Superintendent.

OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc.,  
JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand.

24v22-60w

**Pocahontas Gold Mining Company—Location**  
of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 29th day of November, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 16, Hayward's Building, No. 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
L. A. JENYIN, Secretary.  
Office, Room No. 25, Hayward's Building, 419 California street, San Francisco, Cal.  
dec2-5w

**Seaton Mining Company—Location of**  
Works, Drytown Mining District, county of Amador and State of California.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 27th day of October, 1871, an assessment of \$20 per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 438 California street San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 2d day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the 30th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.  
JOEL F. LIGHTNER, Secretary.  
Office, at No. 438 California street, San Francisco, California.  
nov4-4w

**Starlight Gold and Silver Mining Company**  
—Location of works, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 1st day of November, 1871, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office in San Francisco. Any stock upon which said assessment shall remain unpaid on the 11th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 2d day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
DAVID WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal.

**THE HESSE GRINDER AND AMALGAMATOR.**

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

**IN THE REDUCTION OF SULPHURET ORES,**

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

**Varney's Patent Amalgamator.**

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they  
have no equal. No effort has been, or will be spared,  
to have them constructed in the most perfect manner,  
and of the great number now in operation, not one has  
ever required repairs. The constant and increasing de-  
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly  
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces  
the pulp to the center, where it is drawn down through  
the aperture and between the grinding surfaces. Thence  
it is thrown to the periphery into the quicksilver. The  
curved plates again draw it to the center, where it  
passes down, and to the circumference as before. Thus  
it is constantly passing a regular flow between the grind-  
ing surfaces and into the quicksilver, until the ore is  
reduced to an impalpable powder, and the metal amal-  
gamated.

Sellers made on the same principle excel all others.  
They bring the pulp so constantly and perfectly in con-  
tact with quicksilver, that the particles are rapidly and  
completely absorbed.

Mill-men are invited to examine these pans and settlers  
for themselves, at the office, 239 Fremont Street,  
San Francisco.

## Designing and Engraving

By the Best of Artists,  
At this Office.

## To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed to, "DEWEY & Co., SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

### DEWEY & CO.,

United States and Foreign Patent Agents, publishers Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

## Office or Shop Room TO LET.

Two Rooms (or one large room), with sunny front, to let at favorable rates at 414 Clay street. Enquire at this office or on the premises.

## FAIRMOUNT MACHINE WORKS, 2106 WOOD STREET,

Power Loom Works, N. W. Cor. Hamilton and 21st Streets,

PHILADELPHIA, PENN.

## THOMAS WOOD,

MANUFACTURER OF

## POWER LOOMS,

Spooling, Winding, Beaming, Dyeing and Sizing Machines.

ALSO SELF-ACTING

WOOL SCOURING MACHINES.

Plans taken and Factories fitted out complete with  
**SHAFTING AND GEARING.**

PULLEYS, COUPLINGS AND SELF-OILING HANGERS,  
ADJUSTABLE OR RIGID BEARINGS  
ALWAYS ON HAND.

ADJUSTABLE SELF-OILING HANGER.

20v23-cow-4t

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

## GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

**BANK BLASTING, COAL MINES,**

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD  
It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

**Price. 50 Cents per Pound.**

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

20v22-3m16p

**BANDMANN, NIELSEN & CO.,**  
General Agents, No. 210 Front Street.

It is one of the Largest, best Illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the western side of the Continent. Its circulation is Rapidly Increasing, and it is very Popular with its Patrons.

### A NEW HUSBANDRY.

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, are to be observed with interest, and read, as reported in the PACIFIC RURAL, with profit by practical and progressive agriculturists everywhere. Sample copies of the PRESS, post paid, 10 cts. Subscription, \$4 a year.

**DEWEY & CO., Publishers,**

No. 338 Montgomery St., San Francisco, Cal. Nov., 1871.

## More Patents for Mining Inventions

Are secured by our SCIENTIFIC PRESS Agency than through all other Solicitors in the United States. As editors and publishers of the oldest, largest and best practical mining journal in America, and proprietors of the principal Patent Agency west of the Mississippi, established in 1860, we have a knowledge of patented and unpatented devices, compounds and processes, employed on this coast, and an experience far beyond that of any other Agency. Our interests are permanent and mutual with the Miners and Mechanics of the Pacific States, and they can rely on us for honest, intelligent and confidential advice, and reasonable charges for all services rendered. If you have a valuable invention, no matter how simple, you had better secure a good patent, with the least delay, through a responsible firm with whom you can freely and quickly communicate. Patent Circulars sent free.

**DEWEY & CO.,**

Patent Solicitors and Counsellors, Scientific Press Office  
S. E. cor. California and Montgomery sts., S. F.

## California File Manuf'g Co.

Potrero, Solano street, bet. Tennessee and Minnesota streets, SAN FRANCISCO.

Manufacturers of New Files.

Old File re-cut and warranted equal to new.

**REAPER AND MOWER SECTIONS, BARS  
AND KNIVES COMPLETE,**

at a saving of 50 per cent. Orders from the country promptly attended to. 9v19-b

## PLUMBAGO CRUCIBLES.

MORGAN'S CELEBRATED PLUMBAGO CRUCIBLES, all sizes (except 25 and 30), from No. 1 to 100, for sale low to close consignment.  
22v23-3m A. S. HALLIDIE, 519 Front street, S. F.

## Hubbard, Lippincott, Bakewell & Co.,

### MANUFACTURERS.

J. E. Emerson's New Patent Flange Toothed Circular Saws, are succeeding all others.

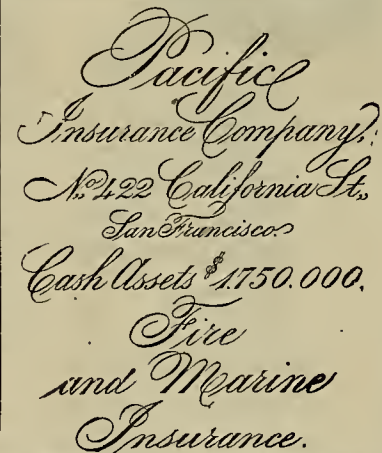

Crosby's Patent Gang Saw Buckle; Lippincott & Tuttle's Patent Cross Cut Saws; Davis' Patent Double Cut Gang Saws (cuts both ways); and all of the celebrated brands of SAWS formerly manufactured by both HUBBARD BROS. & Co. and LIPPINCOTT & Co.

Also, SHOVELS, AXES AND SPADES.  
All orders from the Pacific Coast will receive special attention and be forwarded with dispatch.  
Our extensive facilities enable us to furnish our Goods at the

**Lowest Market Prices,**

And all Warranted of SUPERIOR QUALITY.

For Descriptive Catalogue and Price Lists address  
**HUBBARD, LIPPINCOTT, BAKEWELL & CO.,**  
mail-16p-tf Pittsburgh, Pa.

**J. HUNT,** President. **A. J. RALSTON,** Vice-President.  
**CHAS. A. LATON,** Secretary. **A. BAIRD,** Marine Secretary.

### VICK'S

## FLORAL GUIDE FOR 1872.

Over One Hundred Pages,

Printed in Two Colors, on superb Tinted Paper. Four HUNDRED ENGRAVINGS of Flowers, Plants and Vegetables, with Descriptions, and

### TWO COLORED PLATES.

Directions and plans for making Walks, Lawns, Gardens, etc. The handiest and best FLORAL GUIDE in the World. All for TEN CENTS, to those who think of buying Seeds. Not a quarter the cost. 200,000 sold of 1871. Address, **JAMES VICK,** Rochester, N. Y. 22v23

## W. T. GARRATT & CO. CITY

**Brass and Bell Founder,**  
Corner Mission and Fremont Streets,  
MANUFACTURERS OF

**Brass, Zinc and Anti-Friction or Babbet Metal  
CASTINGS,  
Church and Steamboat Bells,  
TAVERN AND HAND BELLS, GONGS,  
FIRE ENGINES, FORCE AND LIFT PUMPS.**

Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles. **HYDRAULIC PIES AND NOZZLES** for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal." Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf  
W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

## N. W. SPAULDING, Saw Smithing and Repairing ESTABLISHMENT.

Nos. 17 and 19 Fremont Street, near Market,  
MANUFACTURER OF

### SPAULDING'S

**Patent Tooth Circular Saws.**  
They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of  
**Portable & Stationary Saw Mills.**

**MILLS FURNISHED AT SHORT NOTICE**  
At the lowest Market Prices.

### Fulled

### RAWHIDE

**BELTING AND LACING,**  
Made by **H. ROYER,** No. 437 Brannan street,

# SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,  
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 9, 1871.

VOLUME XXIII.  
Number 23.

## Academy of Sciences.

The Academy met on Monday evening, President Blake in the chair. Several ladies were present, which was something unusual, though the members seemed pleased that they should take an interest in their proceedings. Twenty-eight members were present.

### Donations.

A box containing 203 species of shells, corals, and radiates was received from A. Garratt of Tahiti. Henry Hemphill presented several species of rare shells including the *Fidelis var.*, from Dalles, Oregon; the *Cooperi* from Eastern Oregon and the *Helix Idahoensis* and *Helix Stringosa* from Central Idaho. Professor Whitney donated some interesting fossiliferous specimens found about 100 miles east of Elko, Nevada, in limestone. They were sent to the Academy for examination.

Professor Whitney made an interesting verbal report of the progress of the State Geological Survey. Salvador Morhange, Consul General of Belgium, was introduced by the President and read a paper descriptive of White Island, New Zealand, embracing some interesting facts concerning volcanic phenomena.

### Professor Marsh of Yale College

was introduced. As before mentioned he has been traveling since last June with a party of others from the same place for the purpose of collecting the fossils, etc., of the Rocky Mountain region. Many minute vertebrates from the tertiary formation of Wyoming have been gathered and they have made probably one of the finest collections in the world from the upper cretaceous formations of Kansas.

The investigations will furnish a theory which will assist in clearing up a number of geological questions, especially the relations of the ancient fresh water lake basins east and west of the Rocky Mountains. An interesting result of their researches was the discovery of miocene fauna in Wyoming Territory. The Pliocene basin, in Oregon, was found to contain a large number of fossil horses.

Dr. Blake read a paper on the waters of the Geysers and stated that the most remarkable feature was the enormous amount of ammoniacal salts which they contain. The Trustees presented the names of two foreigners—Professors Ebnenberg and Darwin as nominees for honorary membership; laid over under the rules. The volume containing the year's proceedings will be ready next month, or the month following. Academy adjourned.

**COINAGE.**—At the San Francisco Branch Mint, during November, there were 702 gold deposits, amounting to 98,310 ounces and 139 silver deposits amounting to 110,095 ounces. The coinage was as follows: Gold \$1,550,000; silver \$134,000; making a total of \$1,684,000.

**STEEL RAILS FOR CALIFORNIA.**—The *News Letter* says that the ship "Herald of the Morning" is loading a cargo of steel rails at Marseilles, for San Francisco, the first cargo of the kind ever ordered for this port.

## Snow Flakes.

Hast thou entered into the treasures of the snow.—*Job.*

Science alone can teach us to realize the full meaning of the above words. Nothing but inspiration or a higher knowledge than existed for the 2,000 years anterior to the present century, could have enabled Job to have written the sentence we have quoted. The keenest human eye can see but little of the handiwork of God, and nothing but the microscope or inspiration could teach us that almost every drop of water teems with life. Nothing else could make us realize the beautiful forms into which water will crystallize—or "the treasures of the snow."

The annexed engraving represents the various shapes of snow flakes as seen through the microscope. They are found to be composed of perfect crystals of a great variety of the most regular and beautiful forms. "It is impossible to calculate the good the microscope has done the world of

science; even religion has been benefitted by it—microscopic studies having a tendency to lift our thoughts to the great Creative Source of our being, to Him who has not designed the minutest part of the minutest object without reference connected with the whole. With its help we have been enabled to discover life and organization where, before, it was never suspected. A drop of stagnant water, for instance, when viewed through a high power of microscope, presents the wonderful sight of myriads of moving animalcules. Blood through the same medium consists of millions of little globules floating in a red fluid called serum. A crumb of cheese is literally crowded with minute living mites."

**MR. PHILLIPS' BOOK.**—We have received and just supplied a liberal number of orders for the "Miners' and Explorers' Guide." A limited edition only has been printed.

**EX-GOVERNOR BIGLER**, who twice filled the executive chair of this State died last week. He was among the first to advocate the absolute freedom from taxation of the mines and was the author of the popular phrase, "Let the mines be free as air."

## Our Mining Prospects.

The recent mining developments, in Utah and Eastern and Southern Nevada, have had the effect of directing public attention to those localities, and during next season, we may look to see that entire region, extending even into Northern Arizona, pretty thoroughly prospected. As soon as the snow is off the mountains, parties will be out in all directions, examining every part of the country, and discoveries, surpassing all hitherto made, are predicted. Whether these anticipations are realized or not, the character of the comparatively unknown portions of Utah and Nevada will be definitely ascertained, and the question of their mineral wealth, set at rest. The Utah Central Railroad is being extended southward, through Salt Lake Valley, and will eventually connect with the Southern Pacific, and in a short time the whole country will be opened up, and its mineral resources be as well known

## Meeting of the Mechanics' Institute.

A quarterly meeting of the Mechanics' Institute was held on Saturday evening last, in the library hall. The report of the Board of Managers was read. It showed that the Fair had been open to the public 24 days; number of exhibitors, 1,029; total receipts, \$62,846; total disbursements \$30,991.91; net proceeds, \$31,854.09.

The amount applied during the past term to the liquidation of debts owing to creditors of the Institute, \$20,438. Amount realized in sale of building and fixtures, \$6,800. Balance on hand and due, which has now been transferred to the Board of Trustees, \$19,096 85.

The report recommended that hereafter the practice of awarding premiums to the exhibitors be discontinued, and also suggested the propriety of procuring a permanent building for exhibitions, provided it could be done without great outlay.

### President's Report.

The report of President Hallidie showed that the debt of the Society had been diminished from \$37,000 to \$5,000. That in March, 1868, when he assumed the duties of his office, it amounted to \$53,000. The remaining debt was so small that it could be easily extinguished.

The present membership numbers 1,143, with an average monthly increase of 30.

During the past quarter, 85 new members had joined the Institute; 385 books had been purchased; \$15,000 had been paid to extinguish debts. There remained, as a balance of cash on hand, \$1,161.89; moneys receivable, \$2,935; moneys payable, \$1,500.

The financial accounts are as follows: Current receipts, \$3,240; current expenses, \$2,984; quarterly balance, \$256. The President congratulated the members on the healthy financial condition of the Society, and his report was received with applause.

Notice of motion to amend the Constitution and By-laws was given by a member, and the meeting then adjourned.

**RELIEF HILL GRAVEL MINES.**—A gentleman in this city gives us the following items: The channel proper of the Great Blue lead at this point is over 2,000 feet in width, and recent developments prove that the pay gravel continues from rim rock to rim rock. The lucky owners are just getting fairly into their mines, after years of persevering labor. The recent "clean-ups" of the Wbat Cheer and Walkinshaw Consolidated, Eagle, North Star and Union companies, showed a yield of from \$16 to \$30 per day to the hand. The above mines cleaned up, September 27, over \$20,000; middle of October, \$5,000; and November 13, \$14,673.34.

The gold in this ancient river bed is very heavy, especially in the centre of the channel, where pieces are frequently found weighing from one to five ounces, and sometimes as high as 15 ounces. The above claims have from 300 to 1,500 feet frontage, and one mile in length. The banks vary from 75 to 200 feet in height. The hill known as Relief Hill is situated 3 miles from North Bloomfield, and 17 miles from Nevada City, Cal. The net profits of these claims for less than two months exceeds \$30,000.

The Gold Bluff mines, at Downieville, Sierra county, made a partial clean-up in the early part of November from a 15-stamp mill of over \$9,000.

as those of the districts along the Central Pacific, are at present.

The distant and out-of-the-way portions of California are also claiming much attention, and some localities heretofore overlooked, are found to contain rich gravel beds and quartz leads. This is especially the case in the northern part of the State. Siskiyou county, whose remote situation has caused its mineral wealth to be almost entirely neglected, is now known to possess some of the most valuable and extensive gold bearing quartz veins and placer mines in the State, and important enterprises are being inaugurated, to develop them.

In the older mining counties, foreign and eastern capital is being introduced, and indications on every hand lead to the belief, that the coming year will be one of the most important in the history of mining in this country. The three great requisites for successful operations, capital, cheap transportation and improved processes of reducing ores, are becoming more available every day and are destined to inaugurate a new era of prosperity in mining enterprises on the Pacific Coast.

**MR. DARWIN** is engaged on a work in which the facial expression of animals will be one of the chief topics discussed.

## MECHANICAL PROGRESS.

## Audacity in Invention.

As a rule, useful inventions are the offspring of the most deliberate calculation, and their practicability is likely to be in the same ratio as their correspondence with the teachings of experience. Sometimes, however, as if to confound the wise, there occurs a marked exception to the rule. Among these was the example of a steel headed rail, now quite extensively adopted. For years an effective method of welding a steel top to an iron web had been sought in vain, until an audacious inventor proposed to put them together without welding.

The steel cap was simply so shaped that the pressure of the train would tend to converge its lateral portions upon the web below. Few believed that the plan would work; but practice showed that the jarring concussions of the wheels that had knocked the caps from other compound rails had hammered this the closer to its place, and so a daring thought and bold experiment counted for more than this most careful consideration would have done.

In another instance an inventor evolved from his inner consciousness a plan of setting the loose tires of wagon wheels without removing and heating them, as had been previously done in tire-setting machines. He proposed to compress an iron strap around the tire without taking it from the felloes, and by thus upsetting the metal upon itself diminish the diameter of the tire until it came firmly and fixedly to its place.

Most people would say that to thus upset cold iron would take more power than could be conveniently applied to this apparatus. But the inventor, nothing daunted by this apparent difficulty, tightened the iron-compressing strap with a four-foot lever and a two-inch screw; found this experiment a complete success, and built up a prosperous business upon this patent by which he secured the improvement. Examples like these, while they should not lead to hare-brained enterprises, are sufficient to show that sometimes, at least, a little courage gives better results in invention than placid and cautious "common sense."—*American Artizan*.

**IRON STEAMBOAT BUILDING ON THE MISSISSIPPI.**—The question of building iron steamboats, to take the place of wooden ones now plying on our Western rivers, is beginning to receive serious consideration. A correspondent of the *St. Louis Democrat*, writing from Chester-on-the-Mississippi, says that an agent of an English company, from London, not long since visited that locality with a view to the establishment of a yard to build iron steamers. The location is on the Illinois shore, but forty miles away from the great iron fields of Missouri, and with the water lower in the Mississippi than has been known since 1838, there is now a depth of thirty or forty feet for a distance of at least one and a half miles the whole width of the river.

It is claimed that "with the necessary facilities," iron steamers can be as cheaply built there as anywhere in the United States, or even on the Clyde. Arrangements are said to be now making for the manufacture of iron, and practical men, who expect to invest millions of dollars as fast as the work can be prosecuted, say that iron can be made at Chester \$10 per ton less than at any other place in the United States. When this fact shall have been satisfactorily demonstrated, the destiny of the place will be settled beyond question.

**THE ROLLING OF GUNBOATS—A NEW FACT ESTABLISHED.**—The British gunboats *Bustard* and *Kite* were recently subjected to experiments in order to test their rolling motion in a sea way, and discover, whether it is easier with the eighteen-ton gun in its position on the platform level with the fore deck, or when it is lowered into the well beneath; and, although the weather was not sufficiently rough to subject the vessels to a severe test, yet the result showed that they are much steadier when the gun is up in its position than when it is below. The *Bustard*, with her gun on deck, made only eleven rolls per minute, and the greatest roll was from 7° to port (leeward), to 4° to starboard (windward), but with the gun below she made fourteen rolls per minute, the greatest roll being 9° to port to 13° to starboard, being three rolls per minute more with just twice the amount of heel. A similar result was obtained with the *Kite*.

## Chapin's Transparent Waterproof Varnish.

The amount of labor required to keep finished machinery untarnished, renders a transparent waterproof varnish very desirable. In a recent visit to the Collins Co's. works, at Collinsville, Conn., we found them using such a varnish on their polished plows, to prevent rust in transportation. Inquiring as to its efficiency, we found that whereas before using it they had been at great trouble and expense in repolishing after transportation, since its use this difficulty has been entirely obviated.

As an illustration of its efficacy, we were shown a machete, or Spanish knife, about two feet long and two inches broad, one side of which had been varnished. This had been repeatedly plunged into salt water and dried, when it was found that on this varnished side the polish was as bright as ever, while the opposite side was covered with a thick coat of rust, making it almost impossible to realize that it was ever polished. We also saw portions of the varnish removed by a solution of potash and water from polished plows, which had been on more than two years, showing as bright a polish as ever.

For the transportation of machinery or any polished metal this varnish is invaluable, as it does away with the use of white lead and other substances now employed which impair the appearance of this metal and injure the finish. In point of economy it is desirable, as one gallon will cover more surface than several gallons of white lead slush, and is, at the same time, far more easily removed.

By the use of this varnish, machinery can be kept bright with a much less outlay of time, and will look nearly as well as an unvarnished surface, and, certainly, much better than most machinery is kept. It is claimed that it is equally valuable for any surfaces exposed to the weather. It also renders paper or cloth perfectly waterproof and, at the same time, transparent. C. V. Chapin & Co., Collinsville, Conn., are the manufacturers.—*Iron Age*.

**INDURATION OF WOOD.**—Wood for use should be guarded against two sources of destruction, decay and abrasion. For the first, there are numerous efficacious preventives, differing in character and cost; for the other there is at present none that can be relied upon. Wood has been saturated with a chemical substance in such manner that, when impregnated with a second, a solid substance would be deposited in the pores, thereby scouring induration and consequent hardening. This process, whatever the chemicals used, is most efficiently carried into practice by forcing the chemicals in solution lengthwise through the wood by hydraulic pressure. We believe that experiments in this line, if successful, would lead to important public benefits, and also prove remunerative to the inventor. As the material would be both water-proof and fire-proof by the process, there would be many uses other than that designated to which it could be advantageously applied in engineering, and more than in one department of the arts.—*American Artizan*.

**HOW THE FRENCH BUILD.**—The French practice in building is a good one. Instead of using flimsy lath for thin partitions, they employ stout pieces of oak, as thick as garden-palings. These they nail firmly on each side of the framing of the partition, and fill the space between with rubble and plaster of Paris. They coat the whole in the same way, as well as the under side of the stairs. Houses are thus rendered as near "fire proof" as if built of stone throughout. Nottingham, England, where they have gypsum in the neighborhood, as in Paris, they form their floors and partitions in the same solid manner; consequently a building is rarely burned down in that populous manufacturing town.

A new horse shoe has come into general use in Paris. It is imperfectly described as being a "narrow rim of iron, which gives perfect protection to the edge of the hoof, without cramping its sole." It is said to require much less weight of metal, and therefore is cheaper. Though not specified, we suspect that nails are not used. It is said to give great satisfaction—it is called the Chanlier Horse-shoe.

**SHAPING METALS—SOMETHING NEW.**—In a process lately proposed for shaping metals, a mold is made in sections to suit the article required, and a sheet of metal is placed in it, after which a cover is clamped on to the mold, and water pressure is conveyed to the interior by a pipe, whereby the metal is expanded to the counterpart of the mold.

## SCIENTIFIC PROGRESS.

## Are Men to Fly.

Darwin tells us that even in the upper region of the air, near the summits of the Andes, vultures may be seen floating onward for miles upon motionless wings. What is the secret of this flotation? Gravitation acts as forcibly on the substance of the bird as on that of the animal. Nor can we believe that there is any buoyancy, properly so called, in the bird's body or wings.

Those vultures, which seemed to float steadily through still air, must have received support from the air in one or more of the three several ways. Either by swift motion, acquired before the floating began and slowly reduced through the effects of aerial resistance, or by the action of aerial currents through which they were carried, or else, while seeming to float horizontally, they were in reality traversing a slightly sloped descending path. Neither of the two former explanations seems available, because the floating motion is continued so long that the frictional resistances of the air would almost certainly have destroyed a large share of the original motion through the air. This would equally happen whether the bird had in the first place urged its way swiftly through the air, or had floated itself off, so to speak, upon a swiftly moving air current. On the other hand, there would seem to be no valid objection against the third explanation; for a single observer, at rest, would have no means of determining whether a bird was sailing along horizontally, or gliding down a gentle incline. But it matters little which explanation of the three we except as the most plausible. The point to be chiefly noticed is the fact that, a heavy body—for this vulture is no chicken, so to speak—can be sustained, for long distances, merely by the supporting action of the air.

There can be little doubt that it is only on account of the perfect steadiness of their motion through the air that they are thus supported. The efforts of aeronautical mechanicians must be directed to secure a similar steadiness of motion for aerial facilities. Granted this, there can be no reason why the powers of steam and iron should not avail to secure an aerial motion even surpassing in rapidity the flight of the swiftest birds. Unless we are willing to believe that birds fly by some power distinct from any which physical science deals with, we seem justified in believing that the bird may be matched, or surpassed, by the flying machines, as surely as the swiftest animals are surpassed by the locomotive. It is encouraging to consider that the actual amount of power necessary to convey a weight through the air (if that support is derived directly from the air), is very much less than that required to convey the same weight by sea or land. In the presence of failing coal supplies, this consideration will one day assume first-rate importance. *Spectator*.

**SCIENCE IN AGRICULTURE.**—A writer in the *Western Rural* makes the following sensible remarks: "The sooner we throw away the phrase Science of Agriculture, and substitute Science in Agriculture, the sooner we shall be on the high-road to scientific farming. It rests upon all science, taking only a portion here and there, just as the animal crops the herbage as he passes along. He can live and even grow fat upon but few varieties, but for his full sustenance craves many. So of the farmer. He can get along better than any other profession with but little knowledge except that of mere art. The moment he reaches after that higher knowledge, it should be in such directions as will enable him to profit by it. 'The principles of science, and not the bare manipulations of art,' is what he should attain; but as a practical man, science, only so far as it may bear upon, or can be applied to his practical art."

**FREEZING BY MECHANICAL ACTION.**—M. Foselli has announced to the French Academy of Science that he had succeeded in producing an amount of cold just below the zero of the Fahrenheit scale, by simple mechanical action creating rapid evaporation. He employs a wheel formed of a spiral tube, both ends of which are open, set vertically and half immersed in the fluid to be cooled, so that the latter passes constantly through the whole length of the tube, half of which is constantly above the liquid, and being wet gives rise to active evaporation and consequent refrigeration within it. The evaporation is increased by a small fan. The principle of which M. Foselli here avails himself is of course well

known, but the multiplication of the point of evaporation by mechanical arrangements according to the method which he has originated, is certainly ingenious; and in hot, dry weather, even a disc of iron turning rapidly in liquid would produce refrigeration.

## Another Grand Scientific Project.

Among the most noticeable events in the progress of science, at the present time, is the efforts that are being made to notice the water and air forces at work on various portions of the earth, to so arrange and present them to the world as to enable man to avoid the dangers which they threaten, or take such direct advantages of the forces themselves as to make them subservient to his interests. We have noticeable instances of progress in this direction in Maury's charts of ocean currents, his publications with regard to the laws which govern air currents or storms, and the great work in which the U. S. Board of Topographical Engs. are now engaged in making daily reports upon the temperature of the atmosphere, position of the barometer, and direction of air currents, etc., throughout the United States.

The above work has thus far been more or less limited in its scope and usefulness, having been confined mostly to the territory of the United States and the seas, gulfs and oceans which surround them. But now we hear of another and still grander project, proposed by Lieut. Maury, for noticing the forces at work on the entire face of the globe, and distributing the information obtained for the benefit of producers and mankind in general. He proposes, with the aid and co-operation of the various Governments of the world, and the use of all the appliances of steam and electricity, to establish a vast system of weather and crop observations and reports, which shall keep producers in all lands informed of what is going on all over the globe, so that they may know where with they are competing and what their prospects are in the market.

"In this age of steam and rapid communication" remarks a contemporary, "the grain-grower of Illinois is a competitor of the grain-grower of the Danube, and the cotton-planter of Georgia must measure the value of his crop by the products of the fields of India and Egypt. That this measure may be accurately made as the seasons advance, Prof. Maury has projected the scheme referred to. He believes that man has already in his hands powers and agencies which will enable the grain-grower of the West and the cotton-planter of the South to know, as the season progresses, the probable supply of the staples in which he is interested in all quarters of the globe, and when the times of harvest come in the different climes, to be informed with approximate precision of actual quantities sent into the market. The benefits of the scheme are apparent; its practicability is no more doubtful than of many other great undertakings which have been carried through to success seemed to be when they were first projected."

## Frost Work Imitated.

Among the curiosities of recent scientific discovery, may be instanced that made by M. Bertsch, and turned to practical account by M. Kuhlmann, the celebrated chemist. M. Bertsch has found that Epsom salts, or sulphate of magnesia, dissolved in beer, together with a small quantity of dextrine, or artificial gum, applied to a pane of glass with a brush, will, on crystallizing, produce the identical designs formed on the glass by frost in cold weather, with this improvement, that the liquid may receive any color whatever, at the option of the operator. M. Kuhlmann, however, conceived the idea of going a step further, and transferring those fairy-like creations to stuffs and papers. By means of a powerful hydraulic press, the minutest details of the figures in question were duly imprinted on the soft metal, and a copy of them in relief was then obtained by galvanoplastic. But in the impression of cotton stuffs, the patterns must be continuous, whereas in M. Kuhlmann's plates the lines at one end would fail to coincide with those at the other, causing disagreeable interruption in the printed designs. To overcome this, he ingeniously effected the crystallization of the cylindrical surface of a roller. A slight rotary motion imparted to it, prevents the liquid from accumulating at any particular point before it is evaporated.

SILVER stains may be removed by bleaching with chloride of copper, and then washed out with hyposulphite of soda, and afterwards with water.

# CORRESPONDENCE.

## Argenta, Blue Wing and Vipona Districts, M. T.

[By our Traveling Correspondent.]  
Argenta District.

This district is situated about 15 miles north of Ryan's Junction, on the main stage road to Helena, and bids fair to become one of the most promising mining localities in Montana. The district was for a long time considered to be worthless, until several parties came here who took an interest in mining affairs, and who built some furnaces and went into business extensively.

### Bohn's Silver Works

are located about half a mile from the town. I visited these works with the Superintendent and manager, Wm. F. Bohn. There is a large frame building, 70x66, and 26 feet high, with additions. Three cupola furnaces are used, each 9 feet square, and 10 feet from bottom to feed hole; chimneys, 30 feet. They each have two tweers. The furnace is lined with large square rocks, found in the vicinity, that stand, on an average, 21 days' run. Six tons of ore are run through every 24 hours, and they turn out about one and a half tons of bullion daily. Two furnaces are run constantly, while the third is being repaired. They have a good water privilege, by means of which they run the crnsber and blower. One of Root's Patent Blowers, No. 3, gives good satisfaction. Twenty men are employed, night and day. They have 60,000 bushels of charcoal laid in for the winter, which costs about 23 cents per bushel. The ores are secured from the different districts of the neighborhood.

They commenced operations in June, 1871, and up to November 1st had shipped 2,700 pounds of silver, retaining the lead to be shipped in the spring. The bullion assays from \$250 to \$500 per ton in silver. The charges are combined of galena and other silver-bearing ores from Bannock, Vipona, Brown's Gulch and Blue Wing Districts; and they claim that, by judicious mixing of the different classes, they are enabled to work to 95 per cent. of fire assay. A composition of clay and charcoal is used in front of the furnace for the slag to run over, which is tamped down solid once a day. A large lump of charcoal is put in front of the tap-hole, to keep it hot. This furnace is similar to the one illustrated in the SCIENTIFIC PRESS of Aug. 20, 1870. These works have been a grand success, and the owners contemplate enlarging them next spring.

### The Tools Mining Company

were the first to commence the smelting business in this section, and have been very successful. The energetic Superintendent, Mr. C. W. Stapleton, has built three furnaces, one for refining. The large furnaces are of the same style as those described above. The company are now repairing their works, and the roads being in a bad condition, will do no work this winter. Among the

### Principal Mines

of this district are the Ferdinand and the Sunnyside, both producing argentiferous galena, and looking well. These mines are located on a mountain back of the town, the formation being of limestone and granite. Quite a number of claims are being worked, with good prospects.

### Vipona District

is located 40 miles north of Argenta, and contains some valuable mining properties. Mr. Patton has one of the best mines, and sells his ore to the smelters for \$35 per ton, on the dump; hauling to Argenta costs about \$25 per ton. Some 15 or 20 lodes are already located, and others are being discovered daily.

### Blue Wing District

is situated 7 miles from Argenta, on the road to Bannock. There are several furnaces running. The Blue Wing mine, owned by A. Murray, has a shaft 180 feet deep on a ledge, the ore of which averages \$50 per ton. The Brick Pomeroy is also a good mine. The "New Departure" bids fair to be a promising mine, and ore is coming out that averages \$50 per ton and upwards. It is owned by C. W. Stapleton.

W. H. M.

## FROM COUNTY TO COUNTY—PLACER.

Eds. PRESS:—Again I find myself amidst the scenes of life and activity among the miners. This county, which has produced such a large amount of gold, still holds in possession unknown quantities of the precious metal which the energetic miners are striving hard to procure. We hear daily of parties finding "big prospects" which bears evidence that the county is not yet thoroughly prospected; still some persist in saying that the mines are exhausted and mining here will soon be an occupation of the past.

On Iowa Hill are located some of the richest gravel deposits in the State; but the scanty supply of water prevents successful operations; still, some extensive prospects are in contemplation and the prospects never were better for having in speedy operation a number of canals, which will supply a naturally well-favored country abundantly.

Preliminary surveys have been made upon several of the most practicable routes from Lake Tahoe down, though none are yet decided upon; also for other canals of lesser importance to be filled from the various branches of the American river. All of these undertakings must prove profitable and their completion will be heralded with joy, as they alone can develop this country—which is rich in mineral, with a soil capable of raising all the agricultural products could it be irrigated. So though the undertaking may appear stupendous, and the difficulties to surmount, many, if overcome, and the work accomplished, they will of a certainty reflect great credit upon the builders, and what is more important, pay fine dividends.

### Truckee, Nevada County.

Now we can consider ourselves high up in the heavens, 5,845 feet higher than at San Francisco. The morning air begins to feel wintry and the frost sparkles brilliantly in the sunlight. It is enjoyable to inhale the pure bracing air of this region, and it bears a fragrant freshness gratefully associated with a pleasing scenery. The town has suffered severely from fire. Three times within twelve months has the devastating element almost swept it away. Three times has it been almost rebuilt, and the last time, I am pleased to see with fire-proof structures. The persistence of the people, despite their misfortunes—which have been successive,—is indicative of good luck.

### The Resources of the Town

are its milling facilities and lumber. There are many sawmills, both steam and water. Yet the forest above but small inroads into its vastness, though the work has been vigorous for three years or more.

### Donner Lake.

Three miles above Truckee lies the well-known Donner Lake, and it will not do to pass it by unnoticed. There is a wild tale connected with this lake, which is known to many of your readers, and here are still the burnt ruins of old cabins and high stumps with names inscribed thereon. The lake is a most beautiful one, looking like a sheet of silver as it opens out to view through the heavy timber that surrounds it. Full of fish, and provided with its little sailing boats, it is a delightful spot to spend a few days in recreation and pleasure.

As we cross the summit, we take a farewell look at our little mountain city, and passing on through a series of snow sheds we are soon raised to the summit 7,017 feet above the sea. On through the grazing and lumber fields the train carries us until in a short time we find ourselves in Placer county once more, and we reach

### Dutch Flat.

Here some of the heaviest hydraulic mining in the country has been done and an enormous extent of ground has yet to be worked profitably with the well-regulated facilities they have at command, and their only drawback just now is a scarcity of water. The town contains about 2,000 inhabitants, and is prospering.

### A Cement Mill

has just been erected by Messrs. Cox & Brown. They are using one of Cox's patent cement washers, which is working admirably, and will undoubtedly prove a successful invention, supplying a want that has long been felt.

### Gold Run.

is three miles from the "Flat," in the heart

of the placer mining district. Though these mines have not proved to be very rich, they have always paid well, and are so conducted that they are valuable. There is no doubt a little emulation existing between this place and its sister town above; but the people bear an air of contentment, and while they try to outvie each other in business they mutually strengthen each other.

### Prof. Goodyear,

connected with the State Geological Survey, has been making quite extensive geological researches this year throughout this section. The miners all desire to hear the result of his investigations which will be of interest to every one connected with mining matters.

### Rising Sun Mines.

Back to the quartz region again, I find located about two miles east of Colfax a fine mill of twenty stamps, and what is evidently a paying mine, judging from some of the specimens I saw, that were finely studded and seamed with gold. The shaft is down about 300 feet, and the work goes on night and day.

### Auburn.

Of this place enough is already known to leave space for but little more. Three miles down the ravine is Ophir. The placer diggings were very rich here, but its wealth is not yet known. The St. Patrick, Bellevue, Green, Shipley, and several other mines are in active operation. The Empire Mill will soon be in operation again. This mill unfortunately was nearly destroyed by fire during September, the loss being severely felt by many. NINO.

## San Diego Mines.

EDITORS PRESS:—Having said in my last week's letter that I would write you again this week, I will give you some further items with regard to our mines. I told you last week that the De Frees' mill had commenced crushing a lot of 50 tons of ore from the Big Blue ledge (owned by Evans & Stratton), that was estimated to return \$50 per ton; but when they cleaned up, much to the surprise of the lucky owners, it returned \$112 per ton. The Owens' lode still shows the large ledge of fine ore spoken of in my last, and certainly have one of the finest ledges in the State. The California is still improving in size and quality; they will soon commence drifting, to take out ore for crushing. The Van Wert Co. are having ore crushed at the De Frees' mill, which, from appearances, will keep up the reputation of that mine for good ore, never having had ore crushed that yielded less than \$22 per ton.

Since the Big Blue rock was cleaned up, there has been a great deal of prospecting in that neighborhood, and Thos. Stratton, one of the owners in the Big Blue, found a ledge showing rich in free gold, about 300 feet above the Big Blue. Col. De Frees also found one on the same hill, the same day, showing as good prospects as any of them. Mr. Joseph Parsons found a ledge on High Peak Hill, last week, that prospects 25 cents to the pound. The Stonewall, Capt. Frang's mine, is looking as well as ever. A new and rich strike was made last week in the Antelope mine, Banner District. The Madden Co. and Kentuck are still taking out rich ore. The Blue Ledge, owned by Capt. Dye & Co., was leased last week to O'Brien & Co. This ledge has as rich ore as any found in the district, and is supposed by many to be on the same ledge as the famous Golden Chariot, or King mine, being on the same range, and the ore being very similar. The Golden Chariot improves every foot they sink on it; the rock now being taken from the mine, judging from the last crushing of \$156 ore, will go \$200. The Redman mine, under the supervision of A. W. Whitney, Esq., has again commenced hoisting rock; the new engine and pump, received from San Francisco last week, having been set to work, frees the mine from water without any trouble, and they will soon have ore enough to commence crushing. Everything now wears a lively appearance in San Felipe Cañon. J. W. Cullen, formerly of the Cary House, Placerville, and Orleans Hotel, Sacramento, has nearly completed a commodious hotel near the McMechan mill.

We have not yet found a ledge that shows ore worth \$52,000 per ton, like the Gwinn mine, in Calaveras; but we challenge the coast to show a district that can

show as many ledges of \$25, \$50, \$100, \$200, or \$500 ore, as Julian and Banner Districts of San Diego county, Cal. We want more capital to assist in developing our mines. L. B. H.

Julian City, Nov. 21, 1871.

## Aveling & Porter's Improved Road Engine.

Dr. OUR NEW YORK EDITOR.  
[Concluded from last week.]

We probably cannot do better than give here a brief table showing the performance of the road steamer "Sutherland" at Tottenhall, compared with that of the "Steam Sapper," of which we have just been speaking at the Star Hill, Rochester. The details of the two performances are as follows:

	Road steamer "Sutherland," with in-larubber tires.			Messrs Aveling & Porter's "Steam Sapper."		
	tons.	cwt.	qr.	tons.	cwt.	qr.
Weight of engine.....	10	10	0	6	4	1
" on driving wheels	7	11	1			
" of train hauled	26	4	0	15	6	2 1/2
Weight of train including engine.....	36	14	0	20	10	3 1/2
Weight of train hauled	2.5			2.94		
Weight of engine.....	3.5			3.94		
Weight of train including engine.....	3.47					
Wt. of train hauled.....						
Wt. on driving wheels.....						
Average gradients....	1 in 20.3			1 in 18		
Maximum.....	1 in 18			1 in 11		
Speed in mis. per hr....	2.05			2.15		

"This comparison shows that, notwithstanding the much steeper gradient, and slightly higher speed, the rigid-wheeled engine took up a greater load in proportion to its weight than the road steamer, while the proportion between the load hauled, and that on the driving wheels, was probably almost exactly the same. These facts, we think, speak for themselves, and we think that they form the most complete reply which could be desired to the somewhat curious deductions—such, for instance, as those contained in Mr. R. W. Thoman's paper, lately read before the British Association—which have been made from the Tottenhall trials by some advocates of india-rubber tires."

From a perusal of the reports which have lately been given in the SCIENTIFIC PRESS, of the trials at Wolverhampton, in soft ground, between the competing engines of the "india-rubber" and "rigid" wheel classes, it will be evident that the rigid wheels got through their work immeasurably better than the rubber wheel; and now it certainly appears as if a properly constructed rigid wheel can, on hard ground, pull at least as great a load as the expensive rubber-wheeled engine, costing nearly double the money at first cost, and also nearly double the money per day to run it.

At the New York State Fair, held at Albany on October 3d, one of Aveling & Porter's Road and Farm Locomotives was awarded the First Premium. It was set at all manner of farm work, such as dragging a ditching machine, threshing, etc.; and then the machine was formed into a train, as it is called, or "limbered up," ready to be hauled away; and the little engine took them along as easily as though each machine had its own team of horses and driver. In this way they were hauled all about the grounds (which were in a soft and greasy state), turning corners, and going up and down hills with perfect ease. Mr. W. Churchill Oastler, of 43 Exchange Place, New York, is the American agent of these engines. He will be happy to furnish any further information in relation to them, that may be desired.

A JOLLY LIFE.—Insects must lead a truly jovial life. What must it be to lodge in a lily! Imagine a palace of ivory or pearl, with pillars of silver and capitals of gold, all exhaling such a perfume as never arose from censer!

Fancy again, the fun of tucking yourself up for the night in the folds of the rose, rocked to sleep by the sighs of summer air, and nothing to do when you awake but to wash yourself in a dew drop, and then fall to and eat up your bed-clothes!

It is said that there are six thousand less cabinet makers in Paris now than there were at the commencement of the recent war, and that furniture carvers are totally without employment.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### AMADOR COUNTY.

**MILLS STARTED.**—Amador *Dispatch*, 2d: A number of quartz mills in the vicinity of Sutter creek and other places in this county, which have been idle for several months on account of the scarcity of water have commenced crushing rock since the recent rains.

**RICH ROCK.**—Amador *Ledger*, Dec. 2d: We were shown by the Pres., of the Kennedy M. Co. a piece of quartz rock, weighing 3 or 4 lbs taken from the Kennedy mine at a depth of 500 ft., literally filled with free gold, and rich gold-bearing sulphurets. The late accident to the machinery has been fully repaired, and the mill is now pounding away on first class rock with enough of the same sort developed, to keep the mill constantly employed for twelve months without further sinking.

### CALAVERAS COUNTY.

**UP COUNTRY NOTES.**—Calaveras *Chronicle*, Dec. 2d: The storm at Railroad Flat has given a sufficient supply of water to give the miners plenty of work.

**W. V. Clark** is hauling pipes to his hydraulic claim preparatory to commencing work, his ditch now being full of water. The German boys, at Independence Flat, have a large pile of drift dirt in their claim ready to wash; and several other claims have drift dirt.

The Randolph quartz mill is now idle there being no rock at present. Most of the claims are sinking. The Petticoat is down about 100 feet, on the new contract, with a fair ledge and favorable prospects.

Rock is being hauled to Clark's hydraulic quartz mill on "Two Dollar Gulch." Mr. Clark is now laying down a new and much larger pipe than the one used. The mill has a capacity of 8 stamps and requires but 15 inches of water.

The Railroad Flat Quartz M. Co., have pushed their tunnel with energy and last week struck a lead.

**GWYN MINE.**—Every thing is progressing favorably. Better rock is being taken out than ever before; and all the batteries are kept in constant motion. The yield of the mine averages \$1,000 per day. New mills are in process of erection and by the 1st of March 100 stamps will be put in operation.

**WORKED OUT.**—The great tunnel claim of Paul & Co., near the Junction, is working out. The tailings yet remain to be washed, however, and it is expected that they will pay fully as well as the gravel did.

### LASSEN COUNTY.

**HAGDEN HILL MINING DIST.**—Cor. Reno (Nev.) *State Journal*, Nov. 25th: The only mine in this district from which ore is being worked is that of the Providence Co. This Co. is 70 ft. down on their lode; at this depth the vein of gold-bearing quartz is 4 ft., wide and gradually growing wider. The cissing walls are well defined. The Co., have a 4 stamp mill, and are running it to its full capacity and average about \$300 per ton in gold. The mill has only been running a short time. The Co., propose to add another battery of 4 stamps in a short time. The Providence lode runs nearly north and south. About 2 miles to the north and nearly on the same range is the Hayden mine which bids fair to be quite as good as the Providence. There are many other mines in the vicinity which have been partially prospected; among them very favorable prospects have been obtained from the Accidental, Ament and Wolverine.

### MARIPOSA COUNTY.

**REBUILDING A QUARTZ MILL.**—Mariposa *Gazette*, Dec. 1st: The Feliciana mine at the head of Buffalo Gulch, has been leased to J. Dolan of Bear Valley, who has let the contract of rebuilding the mill to D. Knight. Work was commenced on it several days ago.

### NEVADA COUNTY.

**A RICH STRIKE.**—Nevada *Transcript*, Nov. 29th: The Murchie Bros. have struck a very rich mine on Little Deer Creek, about a mile from this city. Some years ago they worked the same ledge and took out some very rich rock, when they were compelled to stop for want of machinery. This fall they put up hoisting works and again commenced work. They succeeded in striking a ledge from 2 to 3 ft. in thickness, upon which they have been working for several months. They have kept 4

stamps of the mill on Big Deer Creek in operation and have a big pile of rock ahead. The rock already crushed has paid from \$35 to \$40 per ton and the ledge now looks better than ever.

**MINING.**—From every section we hear of preparations being made for extensive operations, and the indications are that more gold will be taken out during this season than any previous one. New claims are being opened and old ones are to be reworked.

**RICH ROCK.**—The Pittsburgh mine is yielding some very rich rock. The mine looks better than it has for a long time.

**PENNSYLVANIA MINE.**—The Pennsylvania mill, on the outskirts of this city is to receive an additional battery of 4 stamps next week. The ledge is increasing in thickness. The quartz being raised to the surface is very rich, being filled with galena and rich sulphurets, while the coppers after a few hours run are thickly coated with amalgam.

**PROVIDENCE MINE.**—New hoisting works are to be put up and the mill repaired. The mine will be opened in a new place.

**HUESTON HILL MINE.**—Several contractors are taking rock from the mine, and are doing well. A few days ago 20 loads of rock were crushed and the yield was \$2,400.

**THE GOLD TUNNEL.**—The hoisting works on the Gold Tunnel mines are now in operation and the new incline is down to the depth of about 80 ft.

**MONITOR LEDGE.**—Grass Valley, *Republican*, Nov. 28th: The Monitor ledge, 2 miles east of Nevada City, after lying idle for several years, has recently been reopened by W. J. Organ and others. The first 20 tons of rock from the ledge yielded \$20 a ton.

**SALE OF A GRAVEL MINE.**—W. B. McLane and V. G. Bell have purchased of the South Yuba Canal Co. the extensive gravel claims at Blue Tent, known as the Central M. Claims.

**ALTA No. 3.**—Certain parties are making arrangements to recommence work on Alta Hill, adjoining the Hope ground. Alta No. 3 has no less than 100 claims of 100 ft. each included within its location.

**MOORE'S FLAT.**—The mining prospects are good.

**A PERSEVERING CO.**—The owners of the Independent Gravel Mine, adjoining the Town Talk Mine, at Union Hill, have been prospecting their claim for 14 years, and have expended in assessments and labor from \$25,000 to \$30,000. They have a tunnel in a distance of 1,500 ft., and they are now working 30 ft. below the tunnel by means of a shaft. They are working on what appears the main channel, which is about 30 ft. wide, and prospects well. They are down nearly 200 ft., and their prospecting has been done without machinery.

**DARTMOUTH MILL.**—The Dartmouth mill has its new 10-stamp battery with plates and shaking tables nearly completed. Next week the owners expect to commence crushing their gravel and cement. They have recently run a tunnel 325 ft. through very hard rock and struck blue gravel. This prospects well, but the Co. will drive their tunnel ahead, in order to strike a body of yellow gravel, that is exceedingly rich, and known to exist near the blue gravel.

**GOOD GRAVEL.**—Grass Valley *Union*, Dec. 2d: The Picayune Co. in Randolph Hill, has struck good gravel in their tunnel, which is at a point near where the Webster Co.'s shaft first reached the bed-rock. The Picayunes have gravel which prospects so high as 75 cents to the pan. The Co. will begin to wash out gold as soon as water sufficient to open the proper cut below the tunnel can be obtained.

**SCHULKILL MINE.**—The total expenditures at the mine up to Nov. 1st ult., were \$4,031.97. A tunnel has been run 170 ft., the total cost being \$2,975. For sundries the cost has been \$1,056.97.

**KNIGHT OF MALTA LEDGE.**—We yesterday saw some fine specimens of gold bearing quartz taken from the ledge. It is being worked at a depth of 50 ft., and is fully 3 ft. in thickness, with gold visible to the naked eye. The rock is also rich in sulphurets.

**LOCATION.**—National *Gazette*, Nov. 29th: The Declaration Quartz M. Co., have located 3,600 ft. of a quartz ledge on Deadman's Flat, near the Independence tunnel, Grass Valley dist.

### PLUMAS COUNTY.

**STILL PAYING.**—Plumas *National*, Nov. 25th: The Betterton ledge in Mohawk Valley is still paying from \$50 to \$75 per ton.

**NEW STRIKE.**—Wm. Elwell & Co. have discovered a valuable quartz lode in Mohawk Valley, immediately across the river from Betterton's rich claim, and supposed to be a continuation of it.

**ARGENTINE.**—The quartz lode on which Mr. Conklin is operating is paying extremely well—\$30 per ton being the lowest. The ledge increases in richness the lower they descend.

**PLUMAS AND SPANISH RANCH DITCHES.**—The parties connected with the sale of these ditches have gone below for the purpose of consummating the same. Many persons are earnestly engaged in prospecting for paying claims in localities covered by these ditches, which will be put in complete order early in the coming spring.

**SLUICE ROBBING.**—\$200 was realized by some unknown person from the sluice boxes of Asa Healdsted & Co., Rush Creek Flat, last week.

**EUREKA MINE.**—Some very rich rock is being taken out. English capitalists have recently visited the mine, having in view the purchase of the same.

**MASSAO LEDGE.**—Euesler & Co. have located a quartz claim with fine prospects, on the head of the old Massao ravine, and will commence operations in a few days.

### SIERRA COUNTY.

**MINES IN SIERRA COUNTY.**—G. V. *Republican*, Nov. 28th: Miners are only waiting for water to enter largely into operations. Mining prospects have not been so good for years. Many large lumps have been found this season; one from Ksnaka creek, a half mile from Alleghany was valued at \$1,600 with several other pieces from \$25 to \$2 or \$3 each.

### SISKIYOU COUNTY.

**ELIZA MINE.**—Yreka *Journal*: The mill at the Eliza Ledge, on Humbug, is kept constantly in operation to its full capacity, by Lash & Stino, and the quartz crushed, realizes the usual good pay.

### TULARE COUNTY.

**COAL.**—Tulare *Times*, Nov. 25th: F. Bacon of Cottonwood ranch, exhibited to us some specimens of stone coal, which he reports as having been discovered some 30 miles from Visalia. He has sampled the coal and believes it to be of good quality.

## Nevada.

### COPE DISTRICT.

**LUOIN.**—Cor. S. L. *Review*, Nov. 29th: Mines are developing favorably, Buel & Bateman's furnace is ready to start up the first of the month, with thousands of tons of fine carbonate ore in sight, enough to run it for a year at least. The Lucy Emma mine, supposed to be the next best mine in the dist. to the Tecoma, at 90 ft. down, shows a well defined vein, with clay and some good ore.

### EUREKA DISTRICT.

**MCGEARY DIST.**—Eureka *Sentinel*, Nov. 25th: [This is the new district which we mentioned last week.] From E. P. Raines, we gather the following: The first discovery was made about 3 weeks since. The exact extent and value of it cannot be determined yet. The general indications and prospects, however, are promising. One mammoth ledge showing croppings 100 ft. in width, is spoken of in favorable terms. Two claims, of 1,200 ft. each, located on the main vein, disclose flattering prospects. They are called respectively the Rambling Boy, and Fair View. On the former, a shaft has been sunk 27 ft. in good milling ore, assays from which have been obtained varying as high as \$140 per ton. The Fair View ore also shows a value of about \$106 per ton. It is believed that the entire mass of ore contained in this great vein will average from \$30 to \$40 per ton.

**PINTO MILL.**—Matters are progressing finely at the mill.

**MAGNOLIA CO.**—The working of their valuable locations is being prosecuted with vigor, and developing finely. The Newport is being vigorously worked, producing large bodies of ore. A new ore-house is being erected. The work is being done in the shaft by night and day shifts. A depth of 41 ft. has been attained disclosing a width of 6 ft., continuing in ore all the way from the top. On the Newport No. 3 the ore is being sacked ready for shipment, and is of very high grade. Another location south of the Newport is called Meredith, shows a fine body of ore uncovered.

**FISH CREEK DIST.**—This shows a good prospect of becoming one of the leading dists. Mr. McCormick the first discoverer of the ledges has made many locations, some of which prove to be of most excellent quality, both as to richness of the ore and extent of the deposits. The Queen ledge is considered the most promising of the vein, containing galena ores running as high as \$542 in silver. The galena is mixed somewhat with carbonate of silver, and is perfectly adapted to smelting purposes.

**MORGAN DIST.**—Some weeks ago H.

Hamilton and others started out on a prospecting trip. First visiting Fish Creek Dist., they proceeded on westerly from there, and struck similar good indications, which, on investigation proved of considerable extent and value. The party immediately formed a dist. naming it Morgan. This new dist. is about 15 miles in a southeasterly direction from Eureka, and is well supplied with wood and water. But little work was done on the location made, but that revealed good rock, averaging by actual assays from \$50 to \$200 per ton. The ore was principally milling rock, though good indications of base metal existed.

**DIAMOND DIST.**—E. J. Elzy, one of the owners of the Champion series of mines, says that at no time since their discovery have the various locations looked so well. Pieces of mineral shown us to-day are evidences of exceeding richness; in fact in some places "the pure stuff" could be cut with a knife. The property is under bond and will probably change hands soon.

### ELY DISTRICT.

**BULLION.**—Pioche *Record*, Nov. 26th: W. F. & Co. shipped since Nov. 19th, bars of bullion valued at \$75,922.43.

**RAYMOND & ELY MILL.**—Everything in and around this mill is progressing finely. The building for the new 30-stamp mill is going up rapidly, and will be in complete readiness for the machinery, which is looked for almost daily.

**NEWTON BOOTH.**—The claim is located on the flat at the upper end of Main street, but a short distance from the Lightner shaft of the Raymond & Ely Co. The first contract of 50 ft. was completed some time since, and a second one has been let to sink the same depth, and is nearly completed, the shaft being down about 80 ft. Indications are most flattering, as one ledge has already been cut through and good ore is again coming in on the bottom.

**NEWARK.**—Mr. Caldwell, an owner in the Newark mine, situated about 500 ft. east of the Lightner shaft, showed us a fine specimen of ore closely resembling that taken from the above shaft, which had been struck at a depth of 90 ft. They have a good vein at that depth, with a prospect of it coming in big within 10 ft.

**ANOTHER MILL.**—H. Raymond is about to erect a 10-stamp mill in Bullionville, close to the old 5-stamp mill. Machinery, etc., has been ordered, and the work will be prosecuted with vigor.

### HUMBOLDT.

**BULLION.**—Humboldt *Silver State*, Dec. 2d: Amount shipped from the Arizona mine, since our last issue, was \$6,795.

**CONTRACT LET.**—The Peru M. Co. has let a contract to sink 75 ft. on their lode, and to drift on the present level of the tunnel the same distance ahead, the contractors to have all the ore taken out as compensation for their labor.

**SHEBA MINE.**—The workmen are bringing to the surface large quantities of shipping ore of a superior quality. They have struck into a very large body of the kind of ore which made the Sheba mine famous in the early days of Humboldt mining. The mine is looking very well.

**NEW FURNACE.**—The Pioneer Co. has determined to build a furnace at an early day.

**ECLIPSE MINE.**—The owners are pushing work with energy. From the point where the ledge was struck in their main tunnel they are driving both ways with 2 sets of miners, taking out the ledge as they progress, which is found to be nearly all pay ore. The north drift, which drives straight into the mountain, is now in 60 ft. from the main tunnel, and shows a ledge full 4 ft. in thickness, carrying considerable quantities of good shipping ore, while nearly the whole of the remainder may be classed as a good quality of milling ore.

**WILD ROVER MINE.**—For several months past some miners have been quietly at work, on a claim in Sacramento Cañon, not far from the Old Webster mine. At a depth of 70 ft., reached a short time ago, they came upon a 4 foot ledge, containing large quantities of black sulphurets ore, which created quite an excitement. The Wild Rover is situated about 9 miles from the Central Pacific R. R.

**CUMBERLAND MINE.**—This mine in Gold Run Dist. has been leased, or bought, by the Ahurn M. and M. Co. at Reno, which has put a force of men to work upon it.

### REESE RIVER.

**FINE BULLION.**—Reese River *Reveille*, Dec. 1st: The Metacom mill started out with a good showing. Mr. Barclay, showed us the finest bar turned out by the mill since the introduction of the late improvements. It weighs 78 lbs and is stamped as follows: No. 1; oz. 1143; fine, 930; value \$1,284.64.

**PRUIN AND PULLEN.**—Good ore is coming from this mine in considerable quantity.

ties. The ledges are still large and look well.

**A NEW INCLINE.**—Williams and Sandow are sinking an incline just above the Jane Ledge works on the same lead. They are down about 36 ft., have a large ledge, and are getting a considerable quantity of ore. The rock is of low grade but looks well.

#### WASHOE.

**OVERMAN SHAFT.**—Virginia *Enterprise*, Nov. 26th: The new Overman shaft was yesterday down 250 ft.

**OPHIR SHAFT.**—The new Ophir shaft was yesterday down 1,162 ft.

**ITEMS.**—Gold Hill *News*, Dec. 2d: Last week the Hale & Norcross yielded 1,000 tons of ore. The average value of which was \$37.60 per ton. The Chollar Potosi yielded 934 tons, the assayed value of which was \$41,000. This mine shows improvement of late in its ore-producing sections.

#### WHITE PINE.

**EBERHARDT.**—White Pine *News*, Nov. 25th: A fair quality of ore is now in sight and is shipped to the mill by tramway. The drift running from the Keystone shaft is going ahead as usual. A marked improvement has taken place in the character of the ledge matter since last report.

**NORTH AURORA.**—The three drifts from the Lado's Chamber to connect with the Ward Beecher are going ahead steadily. The drift running south from the Risdale chamber is in a body of over-average ore, which is hoisted from the Attwood shaft and sent by tramway to the mills.

**WARD BEECHER.**—The east drifts running from the Phillips shaft continued to show an abundant quality of good ore.

**SOUTH AURORA.**—The object in putting the Mitchell shaft down is to make connection with the lower tunnel. Fair beadway is made in sinking. The drift to connect the Turner with the Trewell shaft is going ahead steadily. Fair progress is made in the lower tunnel, with the appearance in the face as reported last week.

**GENESEE.**—The new shaft is going down with fair speed. The formation now in the bottom is quartz.

**POCOTILLO.**—The tunnel is running ahead in good ore.

**GEN. LEE.**—The sup. commenced shipping ore to mill to-day.

**NOONDAY.**—The extent of ore body has not diminished, and the grade keeps up to an average of \$100 per ton. Ore is being shipped for reduction at the Big Smoky mill.

**EDGAR.**—The drift from the 100-ft. shaft is in a body of ore the extent of which cannot readily be determined, as neither foot nor bang wall has yet been reached.

**GREAT WESTERN.**—Contractors have pushed the new contract ahead 12 ft. since our last report.

**ASBURY TUNNEL.**—The main tunnel is in about 300 ft., and the side drifts are pushed ahead as usual. Bunches of ore come in frequently in the side drifts.

**SILVER WAVE.**—Work on the 4 shafts now in operation is done by contract. The Perkins shaft is down 27 ft. in limestone. Lyford, down 50 ft., with spar in the bottom. Chenoweth, down 88 ft., with quartz and spar in the bottom. Shaft No. 4 is 104 ft. deep, with quartz, spar and mineral (mixed) in the bottom. A force of men will be put on shortly in the old chamber, where there is a fine body of ore in sight.

**EAST SHEBOYGAN.**—The English Co. have made the final payment on this property. Connection is nearly made between the Exchange and Regent shafts, and the ore now in the face of the drift is of higher grade than has ever been taken out before. The ore body in the South original tunnel holds its own for high grade ore. The ore house will be up the coming week.

**OUTSIDE DIST.**—Piedmont.—A shaft is sunk on the South end to a depth of 70 ft., and a large body of ore cut which assays from \$50 up to \$300 and \$400 the ton. On the southwest a shaft has been sunk to a depth of about 60 ft., and the ore is about the same quality as in the other shafts.

**TRIOY.**—Work will commence on the furnaces as soon as the brick is burned. Hoisting works are in course of erection, and will be completed as soon as possible.

**FRIEBERG.**—The Morning Star has been purchased by Judge C. C. Goodwin. A force of men are now at work opening the mine.

**GRANT.**—Miners are at work developing the mines of this camp, which are looking well.

**WEST SIDE—TRENCH.**—The ledge has taken a well-defined course, with hanging wall pitching northeast. The ore averages 3 ft. wide, and shows the same quality of ore as reported heretofore. Hoisting and piling on dumps.

**MILLS—INTERNATIONAL.**—Running on Co. rock.

**OASIS.**—Running on Co. rock.

**MANHATTAN.**—Running on Beecher con. rock.

**STANFORD.**—Running on South Aurora rock.

**SWANSEA.**—Working Edgar rock.

**MONTE CRISTO.**—Running on Trench rock.

#### Arizona.

**PINAL MINES.**—Thoson *Citizen*, Nov. 29th: From a private letter dated Florence Nov. 9th, we extract as follows: We (Capt. Korr and others) have, in a prospecting tour of less than three weeks, located some 18 or 20 splendid looking silver lodes, and formed three mining districts—all favorably situated in regard to wood and water.

Our first success was the discovery of the Holsted Dist., some 15 miles up the Gila road from Florence. Our first location here was the Kerr Lode—an immense ledge which crops out boldly in some places 40 feet from the surface and can be traced for miles on each side through a limestone and slate formation. This is a true Ossure vein, and shows metal in large quantities in places along the ledge. The ore is a chloride and grey sulphuret rock, with a small percentage of copper and antimony and perhaps a little arsenic. The other ledges in this district are of the same character varying in size and richness but all shows good prospects.

From Holsted Dist. we went to the picket post, where we were lucky in finding a very rich ledge the Silver Queen. Samples of the rock went over \$6,000. We made 5 other locations in this Dist., all showing fair prospects, but none so rich as the Silver Queen.

Our third discovery, the Nevada Dist., embraces along Mineral creek, where we will find placer diggings, as the country looks favorable. In this Dist. our rock is all smelting rock; as far as we have yet discovered it is argentiferous galena and grey and yellow carbonate ore, the same character as the Emma Rock, Little Cottonwood. Some pieces that we made a rough assay of, went over \$600.

#### Colorado.

**MTS. LINCOLN AND BROSS.**—Caribou *Post*, Nov. 25th: The Moor Lode, Mt. Bross is exposed for 400 ft., disclosing a crevice varying from 12 to 18 inches in width, and of nearly uniform value. Before the cold weather set in 40 tons of this ore were raised and netted \$300 per ton. A parcel from the Dwight Lode, belonging to the Moor Co., returned \$280 per ton.

**MINING.**—The Hinds & Heitzer stamp mill, at Middle Boulder, is obtaining from 8 to 9 ozs. of gold per cord from the lot of coarse Trojan ore on which it is making its test run. The Trojan is to be worked this winter for stamp-mill quartz. The Boulder Co. is now worked at 5 different points, and much smelting ore is being raised, but a great deal more of very good stamp-milling ore.

**PARK CO.**—Cor. Central City *Register*, Nov. 22d: Breece, Barnard & Co., are in exceedingly good pay on their end of the "Printer Boy."

J. M. Paul & Co. run through \$9,000 worth of ore last month, from their lode, the "Printer Boy;" \$3,000 was the expense.

Mining on the river is being prosecuted vigorously. A great many are rocking, but more eluicing.

The "Pilot" mine is yielding satisfactory results. The "Five-Twenty" mill will be run by Paul & Co. as long as the water will permit. They have water sufficient to run 10 stamps only.

No work has been done on the "Yankee Blade" lode, at Granite, for over a month. The lode is said to be very profitable, but its owners are "freezing" each other out.

#### Idaho.

**BULLION SHIPMENT.**—Silver City *Analanche*, Nov. 25th: W. F. & Co. shipped from here this week 7 bars, valued at \$8,800.15.

**STARTED.**—Idaho *World*, Nov. 25th: Carvan's mill at the Keystone ledge started up last Thursday and has been running steadily ever since. There is a good supply of ore on hand, and the mill will run for some time before any clean-up will be made.

#### Montana.

**KEATING LODE.**—Helena *Gazette*, Nov. 20th: J. Keating of the Keating Lode, at Keatingville, Jefferson Co., brought in yesterday a piece of amalgam worth \$8,143, the result of the last run.

**HELENA SMELTING WORKS.**—The 4 stacks of the smelting works are completed and stand above the roof of the building. We believe that everything will be ready and operation will be commenced on the first proximo.

**WEST SIDE.**—The mines in Bear and Deep gulches are doing well. H. Brown

has leased the Camanche mine and the James Stuart mill at Phillipsburg.

**LAROE CLEAN-UP.**—Conrtr Wright & Harvey made a clean-up last week from the Evelina Lode of some 400 ozs. They have some 24 men at work in the mine, and are keeping the Harvey mill in full operation crushing quartz. The Evelina is on the Park, just above Unionville, and, has been yielding heavier than any mine in this vicinity.

**JEFFERSON CITY ITEMS.**—A Co. is putting up a large furnace a short distance west of town. It will be finished in two weeks.

The lodes around here that have been lying idle 4 or 5 years past are being developed by their owners. There are more than 80 miners working between the Gregory lode and Clancy creek, sinking shafts and running tunnels, and all around us can be seen on every hill, men sinking shafts and opening their leads, while others are prospecting. A few good leads have been discovered during the past month.

#### Utah.

**LITTLE COTTONWOOD.**—S. L. *Tribune*, Nov. 25th: Some very rich mines have been opened lately that did not crop out—blind lodes, that merely show a small seam of ochre below and near the surface. Several of these that have been followed down during the last 30 days have resulted in important discoveries of rich ore. One called the Lexington, south of Central City, and about 1,000 ft. above the town, at a depth of 20 ft. shows a body of ore 7 ft. wide, that ranges in assays from \$80 to over \$400, with regular pipe clay walls. A peculiarity of this vein is that the ore so far is ochre that can be picked and shoveled out without any blasting,—quite light, and containing chloride of silver and some gold, but no galena as yet.

**CAMP FLOYD.**—The Silver Cloud owners are preparing to work on an extensive scale, having laid out a tunnel 600 ft., which is already made 125 ft.

The ore generally in the dist. is similar to that of the Silver Cloud, and a new discovery called the Little Pem, assays all the way from \$50 to \$8,000.

A number of assays on ore from the Vespasian mine, Bingham Canon, prove it to be one of the most valuable mines in the county.

**STAR.**—The dist. is only a few months old and has already 100 locations. A statement of assays show, that there is rich ore in the Horn Silver lode, going as high as \$1,240.

Work is to be prosecuted with vigor in the mines of Little Cottonwood during the winter. In the Flagstaff shaft the ore is to be let down on sleds a distance of 1,640 ft.

The Emma mine is getting out its usual amount of ore, and expects to continue shipping through the winter. It will send along some 40 tons per day.

The Davenport is to resume work in a few days, and the Wellington is working right along and will continue to do so, as also the South Star.

**OPHIR.**—Cor. S. L. *Review*, Nov. 24th: The Irene, is on the south side of the canyon, about 500 yards from the Brevoort mill. The vein is 6 ft. wide and had only 15 ft. in, and produces free milling ore. It has a slate wall on one side and limestone on the other, and is a fissure vein.

Close to this mine lies the Malakoff, a new discovery, and an extension of the Irene. They are sinking a shaft and it already shows a vein of 14 ft. Two assays on the Irene ore have been made, one \$500 and the other \$800.

The Black Hawk mine a few feet below the Irene shows a vein of 5½ ft. of regular black spar and free milling ore; no base metal whatever. They have tunneled in the mine about 16 ft.; the average of 8 assays yields \$60 to the ton.

This mine is very close to the mill, the distance being about 100 to 125 yards. There is a shaft on the ledge about 40 ft. in depth, the ledge being 5 ft. wide; it is free milling ore, and assays from \$300 to \$400. There are 1,000 ft. in the mine.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For home use and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original 'Home' Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chicory Mills, Cruges, Belgium. fe25-ly

**N. Seibert's Eureka Lubricators** for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 126 First street, San Francisco. 8v23-3r

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Nearborn street, Chicago, Ill. 23v1-12mbp

#### San Francisco Mining Stock Market.

THURSDAY EVE., Dec. 7, 1871.

There was no session of the Stock Board on Thanksgiving Day. Stocks have been in fair demand during the latter part of the week. Only 520 tons of ore were taken from the Chollar Potosi last week, assaying \$36.40 per ton. Bullion shipment on Saturday, \$11,000. From the Meadow Valley mine, \$145,000 have been received on November account. During the month of November, 5,700 tons of ore were sent to mill from the Belcher. The receipts from the Caledonia mine for November, were \$26,500. The Chollar Potosi Mining Company's receipts for November, were \$76,000.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

Sulphurets containing gold may be assayed either by fusion in a crucible with the proper fluxes, or by scorification. Many assayers consider the crucible assay the best, but experience has convinced me that scorification gives the most correct results. To allow the reader an opportunity to judge for himself, I shall give both methods in detail.

Before a crucible assay can be made, the sulphurets must be roasted, and if not already fine must be pulverized and sifted. It is now generally admitted that a mechanical loss of the precious metals occurs even when the sulphurets are roasted with the greatest care. Unskillful manipulation often leads to mechanical loss of the assay by portions being thrown over the sides of the vessel used, during the constant stir-

with more care. As the roasting progresses, the assay becomes less and less fusible and may be gradually pushed back to the hottest part of the muffle until it has attained a red heat and no more fumes or odor are given off.

The assay is then removed from the muffle, allowed to cool, and transferred to a good Hessian crucible. Litharge equal to six times the weight of the assay, its own weight of borax, about one gramme of argol or charcoal and a mixing spoonful each of carbonate of soda and carbonate of potash, are put into the crucible with it, and the whole stirred thoroughly with the mixing spoon. The crucible must then be tapped against the table to cause the charge to settle down level.

The surface of the charge is then covered evenly with common salt. Upon this are to be placed several lumps of borax, and the crucible is ready for the fire. Two crucibles should be prepared in this manner.

For the fusions a very strong fire will be required. The crucibles may be placed in such position that they cannot fall over,

each milligramme of gold obtained, will equal one Troy ounce of gold to the ton of 2,000 pounds, which multiplied by \$20.6718 will give the value of a ton of the sulphurets.

The assayer cannot be too careful in sampling sulphurets before assaying them. Even with the greatest care in sampling it is difficult to obtain the assays exactly alike.

It is best to make several where great accuracy is required and to take a mean of them all as the correct result.

Sometimes where the roasting has been imperfect, the lead button resulting from the fusion in the crucible is brittle, when this is the case it may be placed in a scorifier with a little borax and melted in the muffle. After 10 or 15 minutes exposure to the air in a fused state it may be poured out into the mould, cooled and hammered. It will then be found malleable and in a fit condition for cupelling.

## IMPROVED CORN HUSKER.

The great extent of the Indian corn crop throughout the United States, makes

for articles not in the list of awards offered.

This machine has taken no less than eight first premiums this season, at fairs in the Eastern States. At the fair at Rochester, N. Y., it was awarded the first premium of \$10, besides a \$50 premium for the most useful invention relating to agriculture, patented during the last three years.

The larger machines for husking from the stalks, can be conveniently run by any of the ordinary horse-powers.

The machine consists of a frame about three feet long and two and one-half feet in width, made of three-inch joists. Across one end and near the top of the frame are placed two picking rolls, formed with screw threads on each roll, and gearing into each other.

The stalks are fed between these rolls and fall in front of the machine, in good condition for binding, and divested of every ear, great or small.

The ears, as they are separated from the stalk, fall upon the husking rolls placed lower down on the frame, at right angles to the picking rolls and in an inclined position.

Upon the surface of one or both the

PHILLIPS' SPIRAL CORN HUSKER.

ring which is necessary to allow the fumes of volatile matter to escape.

The amount taken for assay depends upon the supposed richness of the sulphurets. If of extraordinary richness, ten grammes or even five will suffice, but ordinarily 29.166 grammes are taken for convenience of calculation as shown in a former article.

This amount is carefully weighed out into a large scorifier. This is placed in the mouth of a hot muffle, where the heat is not great. By means of a pair of tongs it is frequently turned until all the water has been driven off. The scorifier must then be pushed forward to a point where the heat is greater. When fumes begin to pass off, the assay must be stirred. This is done with a piece of bent wire, one end of which is fixed into a wooden handle.

If the heat is raised too suddenly, the assay is likely to partially fuse, in which case perfect roasting is impossible unless the scorifier is removed and the contents cooled and pulverized before making a second attempt, but as a loss by such treatment is nearly certain, it is better to weigh out a new charge and make a second trial

and hot coals are then built up around them; when the contents begin to fuse, a cover is placed upon each crucible and the draft of the furnace so arranged that the greatest heat may be produced. After a few minutes the cover of one of the crucibles, must be lifted and the action of the heat on its contents observed. If the charge has melted down and is in a quiet state of fusion, both covers may be removed and that condition maintained for five or ten minutes more. If such is not the case, the cover must be replaced and more time allowed to elapse. It is necessary that perfect fusion should be effected to insure accurate results. When the contents of each crucible are perfectly fluid and intensely hot they may be removed, and after tapping against the sides of the furnace to cause all particles of lead to gravitate to the bottom, they are set aside to cool. When cold the crucibles are broken and the buttons of lead hammered into cubos and cleaned preparatory to cupellation.

In cupelling, the muffle may be very hot; there is no danger of loss of gold as in the case of silver assays. The button of gold which is left in the cupel must be melted with five times its volume of silver, and boiled in nitric acid as described in a former article. This is necessary, as the silver contained in the litharge will be alloyed with it, and would give false results if this were neglected.

If 29.166 grammes were taken for assay,

of the utmost importance any invention by which the labor incurred in its production may be lessened. The slow and tedious process of husking the ears is a great item of expense, and has led to the introduction of many different machines for this purpose, none of which have heretofore fully surmounted all the difficulties encountered, but have proved for the most part failures. The machine, however, represented in the accompanying cut, has shown itself perfectly successful in practical use, and will be of the utmost interest to our readers.

According to the census reports the annual yield of Indian corn in California several years since, was 1,000,000 bushels. It is probably twice that amount at the present time, and the introduction of corn huskers will be of great advantage to our farmers. Both the hand and power machines, of this patent, were worked successfully at the last California State Fair. They were set up without any assistance from an experienced artisan, just as they were received from the manufactory in New York, and were run without difficulty or hindrance, to the surprise and satisfaction of all farmers and others, who witnessed their operations. They were awarded a diploma—the first premium—

husking rolls, are spiral depressions or grooves, which answer the double purpose of allowing spikes to be put upon the opposite roll corresponding with the depressions or grooves, and allowing the ear to settle down between the rolls, so that the grip upon the husk may be more certain. These depressions and spikes being placed spirally upon the rolls, grip the husks first at the end of the ear, and continue the grip to the opposite end, making the process of stripping the husk from the ear very similar to that of hand husking.

The machine does its work thoroughly, stripping the husks and silk from every ear and nubbin, whether it be large or small, hard or soft. The stalks are delivered in a crushed state and in a much better condition for fodder than when left solid, and they also rot quicker in the manure heap. The husks are delivered in so good condition as to be worth from \$50 to \$70 per ton for industrial purposes in some Eastern places.

An ordinary two-horse power used for thrashing will drive the machine, and with the hand machine two men can husk 400 bushels per day.

The machine can be seen at the store of Weister & Co., patent brokers, No. 17 New Montgomery street, under the Grand Hotel, who are agents for the sale of the machine and for State rights for the Pacific States.

## USEFUL INFORMATION.

## Artificial Leather.

Much has been said of late with regard to the production of a new article of commerce, known as "artificial leather," manufactured chiefly from leather scraps. So much interest seems to be manifested in this new article of commerce, that we here reproduce some remarks of a scientific contemporary in relation to its mode of production, its physical characteristics, and its probable future value. We copy as follows:

It is almost superfluous to say anything in regard to the great value of a cheap and good process for the utilization of leather waste. This waste represents millions of dollars annually. A process that could reproduce a texture of these cuttings, only half as good as the original leather, would be one of national importance, and would at once establish a new industry. The process by which the specimens above referred to are made, is, however, claimed to make uniformly an artificial leather even superior to ordinary tanned sole leather.

Examination of these specimens reveals the following facts: It is much harder than ordinary leather, and does not yield to hammering or compression nearly as much. It is very flexible and elastic. Thin shavings of it possess as great tensile strength as shavings of equal thickness of common oak-tanned leather. It is nearly, if not quite, impervious to water. It cuts smoothly and easily in working. With regard to its durability under wear, we have no doubt it would wear longer than sole, provided it does not decompose by exposure. We have no means of determining this latter point, but we are assured that it does not decompose or change under the ordinary circumstances of wear to which leather is exposed in its various uses.

It is claimed that the leather thus made is equally good for soles or belting; and our tests as to its tensile strength, flexibility and elasticity, certainly go to corroborate the claim.

A really good method for making artificial leather of scraps has, as our readers are well aware, long been sought; but heretofore nothing has been obtained that combined all the essential properties of good leather. The method under consideration was first brought out in Copenhagen, Denmark, and has been patented both in Europe and America.

The ingredients employed and their proportions are as follows: For first quality, one pound of caoutchouc for each three and a quarter pounds of leather pulp. For other qualities, the proportion of leather pulp is increased variously up to six for one pound of caoutchouc. The caoutchouc is dissolved in benzine or other solvents, and, when sufficiently dissolved, aqua ammonia is added in the same proportion as that of the rubber, and the mass is thoroughly stirred until it assumes a greyish white color. The leather pulp is then added, and the whole is kneaded into a plastic homogeneous dough of uniform consistency, which can be pressed or moulded into any required form, or rolled into sheets, as may be required.

The ammonia is claimed to act upon the animal glue in the cuttings, restoring to it its usual vitality, which it has lost to a great degree in the process of tanning.

The following are some of the properties and uses of this remarkable substance, as claimed by Mr. Oerting: Its waterproof quality makes it especially valuable for pump leather, as well for cold as hot water, and also for harness, as even a continued exposure to all kinds of weather has no effect on it, occasioning neither rot nor crack. It can be made endless, or of any length, width and thickness required, and of perfect uniformity as to wear, which is generally well known to be impossible with leather belts made of shorter pieces of different hides, and of unequal wearing capacity. It will stand any amount of heat and friction, as well as the most intense cold; will stretch less than any other belting, and can be changed from one pulley to another with ease and rapidity. It is very strong and substantial in the edge, and will stand a great amount of ill use without suffering any injury, and through its combined properties will supply a desideratum much needed. By suitable machinery for moulding, or forming the material in its doughy state into hose, fire-buckets, etc., for which purpose it is especially adapted on account of its impenetrability by water, and its capacity to withstand any amount of hardship, as well as extreme heat or cold, it will certainly

make the best as also the cheapest material yet produced for such purposes.

By a different mixture and proportion of the ingredients, a matting for floor covering is made, which, on account of its cheapness, its waterproof properties, and its capacity to keep rooms protected from cold and dampness, makes, it is claimed, an unequalled article for covering offices, passageways of public buildings, etc., which will withstand an immense amount of wear, and can very easily be cleaned. It is stated by the producer that the cost of the materials employed in its manufacture amounts to about 11 1-7, 13 1-2, 16 1-5, and 19 cents per pound for the different qualities, besides from 12 to 14 ounces of scrap leather, which prices, calculated after the present rates of the raw ingredients, would be reduced at least to 15 per cent. by a direct importation in larger quantities.

**LINSEED OIL.**—Linseed oil is made from the seeds of the flax plant (formerly called lint-seed), by grinding them in a mill, and pressing the powder by hydraulic or other power. When first pressed it is of a golden yellow color, but soon collects impurities from the air and turns brown. The impurities can be washed out by stirring water into it thoroughly, and leaving the water to settle. It contains no stearin, and hence does not congeal at low temperature. Its chief use is in decorative and preservative painting. Being mixed with the powdered colors, and spread on wood, stone or iron with a brush, it soon dries and hardens into a coating which acts as cement, varnish, and shield from weather. To quicken its drying it is often boiled before using. It is sometimes used in medicine as a laxative, and for this purpose is made from the raw seed without roasting. It is quite an important article of commerce.

**VALUE OF AMERICAN PATENTS IN EUROPE.** The American origin of an invention, says the *Anglo-American Times*, is now a recommendation in Europe, where many of these inventions are in successful operation, and large fortunes have been realized by their introduction. Improvements relating to some manufactures are of great value in this kingdom. Mr. Bessemer derives an annual income of about \$2,000,000 from his British steel patents, and the patentee of a device for dressing millstones by a revolving diamond, has realized over \$1,000,000 the first year of his patent. The use of a diamond for this purpose is an American invention, and the estimated value of the exclusive right in England, for ten years, is \$5,000,000. British patents, as a rule, are the most valuable, but many inventions are equally profitable in other parts of Europe, and some are peculiarly adapted to Continental wants and customs.

**MAGNETISM OF WATCH SPRINGS.**—It has recently been discovered that the springs of chronometers and watches, which are constructed of steel, are frequently magnetic. Steel is at all times liable to become magnetized from causes beyond man's control. Watchmakers are advised to test their springs as to magnetism, by placing them near to a very small and truly balanced mariner's compass. If the spring exhibits in none of its circumference any tendency to attract one pole of the compass more than the other, it may be considered free from magnetic influence; on the other hand, if the north pole to the other, the spring is decidedly useless; for in whatever position the time-keeper may be placed with such a spring it will be affected with the earth's magnetism.

**SALERATUS FOR LIFE-BUOYS.**—A self-inflating life-preserver has been devised in Belgium, consisting of a belt containing carbonate of soda and tartaric acid, so arranged that, when the wearer falls overboard, the two substances are mixed and evolve sufficient gas to float him. The idea is said to have been suggested by a shipwrecked apothecary, whose life was saved by the circumstance of his having a box of Seidlitz powers in his pocket.

**NITRO GLYCERINE.**—When nitro-glycerine is caused to fall drop by drop upon a thoroughly red hot iron plate, it bursts off as gunpowder would under the same conditions; but if the iron be not red hot, but hot enough to cause the nitro-glycerine to boil suddenly, an explosion takes place.

**THE Farmers' Club,** of Santa Clara, "solicit communications from all who have information to give, or who desire to receive information from the Club."

**WOOL EXPORT.**—About 12,000,000 lbs. of wool—6,000 tons—have been exported from this State during the past nine months.

## GOOD HEALTH.

## Importance of Healthy Action of the Bowels.

There is nothing which one can do with a little care, more likely to aid decidedly in the preservation of health, than to ensure regular and healthy action of the bowels.

The bowels are properly a tube, canal, or passageway, through which a certain proportion of the waste matter of the body should pass. Mainly, these waste matters are made up of substances eaten which are indigestible, and matters which are secreted in the bowels from the blood, forming what is called feces, or waste matters of the bowels. This collection of matters needs to pass out of the body as often as once in twenty-four hours. If neglect is had in this respect, and the substances there gathered are permitted to remain longer, unnatural heat of the part is established, and so disorder of the organ begins.

I would, therefore, urge intelligent action with reference to the evacuation of the bowels every day, and in this direction of the following suggestions:

**First.** Let your food be made up in part of substances which cannot be acted upon by the gastric juice and made into blood, but which, retaining the original form, are carried all along through the intestines until reaching the lower howel they gather and are cast out at stool.

Whoever eats food which is altogether nutritious, will find after awhile that it is not healthy. A certain proportion of food of every meal needs to be made up of coarse materials which do not make blood. These serve the purpose of exciting the mucous membrane of the intestines to action, thus causing the proper excretion of the waste matters to flow into the howels, and thus aiding in purifying the blood of substances which, remaining in it, would greatly deprave it. The bread which you eat should be unholled, and for that matter, unleavened when cooked. If you eat fruit, a portion of it should be eaten with the skins on, such as that of good nice apples or pears. Berries retain their seed, grapes are healthy for persons of constipated bowels, eaten with the skins, though the seeds should be expelled. Potatoes are more valuable as food if they are haked and the skins eaten, than if they are hoiled and the skins thrown away. If you would insure healthy action of the bowels, eat coarse food.

**Second.** One of the best aids to healthy and regular action of the bowels is the use of soft water. Hard water is objectionable, soft water is very desirable. Wherever, therefore, you may be, if you can get soft water to drink, by all means use it.

**Third.** Wash your body over as often as as two or three times a week. This of itself helps very materially to keep the bowels in a healthy state.

**Fourth.** Taking at evening once a week a sitz bath in water at a temperature of 85° to 90°, and sitting in it twenty minutes, rubbing the howels well with the hand while thus situated, has a direct tendency to promote action of the bowels.

**Fifth.** Having a particular time in the morning, say immediately after breakfast, when you will retire and relieve the bowels of their contents, is of great service, especially so if during the day you are to be confined to your room in study, or occupying a sitting posture. Where one is upon his feet, walking about or working, the period of seeking to relieve the bowels at stool may be left to his own instinctive impression. But where one is sitting down, the posture itself is unfavorable for organic sensibility of the bowels to show itself, and thus to neglect to be regular, is to induce constipation.

Of diseases which render their subjects incompetent for physical or continuous severe intellectual labor, there is none that is more to be dreaded nor any which produces more deplorable effects, than habitual costiveness. I say this because, in my experience among sick folks, I scarcely ever find a person who suffers from severe diseases who is not a sufferer from disordered bowels.

Were I to describe the various ailments, ending in sickness and death, to which persons living in America are more particularly liable, and from which they suffer immensely, it would be difficult for me to enumerate them without counting in as one of the predisposing or provoking causes of their existence, inactive bowels. If, therefore, you do not wish to be sick, be sure that you care for yourself, in this direction, and allow no day to go by without having the howels thoroughly emptied.

In that way you may not only promote your health and strength, but save yourself from severe diseases.—*Lancet of Life.*

## Bed and Bedding for the Sick.

If a bed is higher than a sofa, the patient often prefers not to get out at all, rather than to undergo the fatigue of getting out. If the bed was a low one, he might often feel like taking a few minutes' exercise every day in other rooms, or even in the open air. It is so very odd that people never think of this, or of how many more times a patient who is in bed for 24 hours is obliged to get in and out of bed than they are who only get into bed and out of bed perhaps once during the 24 hours.

A patient's bed should always be in the lightest spot in the room, and he should be able to see out of a window. It is scarcely necessary to say that the old four-post bedstead, with curtains, is utterly inadmissible, whether for the sick or well. Hospital bedsteads are in many respects very much better than private ones.

There is reason to believe that not a few of the cases apparently resembling scrofula among children proceed from the habit of sleeping with the head under the bed-clothes, and so inhaling air already breathed, which is further contaminated by exhalations from the skin. Patients are sometimes given to a similar habit, and it often happens that the bed-clothes are so disposed that the patient must necessarily breathe air more or less poisoned by exhalations from the skin. A good nurse will be careful to attend to this. It is an important part, so to speak, of ventilation.

It may be worth while to remark that where there is any danger of bed-sores, blankets should never be placed under the patient. It retains damp, and acts like a poultice.

Never use anything but light blankets as bed covering for the sick. The heavy cotton and impervious counterpane is bad, for the very reason that it keeps in the emanations from the sick person, while the blanket allows them to pass through. Weak patients are invariably distressed by a great weight of bed clothes, which often prevents their getting any sound sleep whatever.

One word about pillows. Every weak patient, be his illness what it may, suffers more or less from difficulty in breathing. To take the weight of the body off the poor chest, which at best is hardly up to its work, ought, therefore, to be the object of the nurse in arranging his pillows. Now what does she do and what are the consequences? She piles the pillows one upon the other like a wall of bricks, the head is thrown upon the chest, and the shoulders are pushed forward, so as not to allow the lungs room to expand. The pillows, in fact, lean upon the patient, not the patient upon the pillows. It is impossible to give a rule for this, because it must vary with the figure of the patient.

Tall patients suffer much more than short ones, because of the drag of the long limbs upon the waist. But the object is to support, with the pillows, the back below the breathing apparatus and above the hips, so as to allow the shoulders room to fall back, and to support the head, without throwing it forward. The suffering of exhausted patients is greatly increased by neglect of these points. And many an invalid, too weak to drag about the pillow himself, slips his book or anything at hand behind the lower part of his back to support it.—*Boston Journal of Chemistry.*

**Too LITTLE SLEEP.**—Students, as a class, do not sleep enough. There is no law so fundamental and imperative on the student as the law which requires him to sleep, and no other law does he so systematically and recklessly ignore.

It is a popularly accepted fallacy that students and literary men do not require as much sleep as mechanics and laborers. Physiology shows us that, during the operation of the intellect, rapid changes of tissue take place, and that a few hours of close application to thought and study exhaust the system more than two or three times the same period devoted to manual labor. It is evident, then, in order to compensate for this greater waste of tissue, that the brain worker will require more sleep than the muscle worker.

In the violation of this first great hygienic commandment is found the secret of most of the special diseases to which the student is liable. To this cause can be traced the eye affections that are so common. By neglecting to obtain sufficient rest, the system becomes relaxed and its tone lowered, thereby inviting disease, of which these organs, being especially over-taxed and weakened, are the first to become sensible.

## Notices to Correspondents.

THE CAR-BUILDER.—We have examined Rowell's "American Newspaper Book," but have not been able to find the "car-builder." As it is not arranged alphabetically, however, it may have been overlooked.

MR. H. B. GROZE has sent us the result of an assay of some of the Utah tin ore; but as we have already noticed that the ore contains no tin, we do not publish it.

## Mining Accidents.

JAMES PETERS, a native of Cornwall, aged 26, was instantly killed by a cave in the Empire mine at Grass Valley on Dec. 1st.

MYLES FINLAN, a miner in the Hale & Norcross, Virginia City, was severely injured a few days since, by a rock falling upon him.

JOHN CASSILL, a native of County Wicklow, Ireland, aged 38, was killed last week, by the explosion of a blast, in the Oregon mine at Reese River.

A miner, named Germaine Faure, was seriously injured recently, by the falling of a mass of earth, in the Minnesota mine, Idaho.

TWO men named Greer and Moore, while engaged in erecting a Stetefeldt furnace, in the Troy District, White Pine, on the 29th ult., were precipitated to the ground by the breaking of the scaffolding. Greer was instantly killed and Moore slightly injured.

OUR attention has been called to some recent experiments on the comparative efficiency of different kinds of boiler plates for steam generation which we will notice next week.

## HINTS TO MINERS.—NO. 2.

Most of the California miners are familiar more or less with placer mines, but many perhaps know but little as to the causes of the formation of these superficial deposits which are so numerous over the whole State. Mr. Raymond says: "These are always of comparatively recent geological formation. The deposits of debris are accumulations of mineral detached from its original localities by disintegrating influences, and conveyed, generally by water, to a new position. They contain therefore a great variety of material. Sometimes these deposits are simply disintegrated—not washed away. They are then to be recognized by their freedom from water-worn particles, sand, etc., their general homogeneous composition, and their position in places where there are otherwise no signs of alluvial action.

The most frequent deposits, however, have been accumulated by currents of water. The lighter minerals have been washed away, including all those ores, which, by chemical decomposition, assumed forms of small specific gravity, or actually became soluble. Hence it is not common to find pyrites, silver ores, or carbonates, in placers, though the original deposits may have contained all these in great abundance. We find, on the other hand, principally gold, platinum, heavy tin ore, magnetic iron ore, specular iron and precious stones—all substances which combine high specific gravity with indifference to ordinary atmospheric agencies.

The process which such deposits have undergone may be called a natural dressing or mechanical concentration. As in artificial concentration, so in this case, the size and shape of particles has also an influence upon their deposition, as may be seen in the stratified arrangements of sand, gravel and boulders in any river bed. After such a deposit has accumulated, the passage through it of silicious or calciferous waters, together with the pressure of new accumulations above, may cement it together in a solid mass, so that it can only be extracted by blasting, as if it were solid rock.

"It is an interesting question whether gold accumulated in placers increases in the size of its particles. The idea has been scouted by some scientific writers, but there are strong indications that such a process actually takes place. The greater purity and size of nuggets, etc., found in placers, as compared with the veins from which they were formed, indicates an aggregation or inorganic growth, preceded by a chemical reaction, removing silver and baser metals. Genth, in 1859, concluded from the superiority of the alluvial gold of the Southern States, that the veins could not by their decomposition have furnished it; but Oscar Lieber had already put forward a bold theory of the alteration of the gold by solution, precipitation and agglomeration. At that time the chemical possibilities were not fully known. Prof. Bischoff, the eminent chemist and geologist, has since found that sulphide of gold is slightly soluble in pure water. It is now also known that chloride of gold will co-exist in very dilute solutions, with proto-salts of iron, provided there is present an alkaline carbonate and a large excess of carbonic acid."

"If the sulphide of gold is required in solutions, it is only necessary to charge the solution with an excess of sulphuretted hydrogen. In the same connections should be mentioned the discovery, from a different quarter, that metallic gold is soluble in solutions of the persalts of iron. It will be seen that these discoveries give a much larger range and greater probability of changes in the auriferous material once deposited in a vein.

But another and still more important series of experiments has been carried out by

Australian chemists, and corroborated, I believe, in France. The latest reported results of these inquiries are found in a paper on the formation of gold nuggets in the auriferous drifts, read before the "Royal Society of Victoria," by Mr. Cosmo Newberry. The arguments and facts contained in that paper strongly support the theory of the growth of nuggets, and furnish a simple analogy in the precipitation of metallic gold from solution, by the reducing action of organic matter, in the presence of a nucleus.

The nucleus itself may be gold or iron, copper or arsenical pyrites, galena, zinc-blende, or sulphide of antimony, etc.; and upon it the metallic gold collects in irregular grains, accumulating in mamillary, or even crystalline forms. This being the case in the experiments by which artificial nuggets and crystals of gold have been produced, we are led to believe a similar process possible in nature, especially since nuggets of drift gold, when weighed, show frequently a less specific gravity than belongs to the metal; and, when sawn in halves, display, in numerous instances, the oxidized remains of former nuclei.

## Our Home Industries.

One of the most important of the industrial enterprises which have been started in the State recently, is that of

The California Silk Manufacturing Co.

Their mill is located in South San Francisco, and the office and salesroom are at 569 Market street. Messrs. Brown & Peabody are the agents of the company, which is a joint stock concern, and has been in operation but a few months. The machinery at the manufactory is capable of turning out \$3,000 worth of silk per week, but at present it is only worked to a capacity of \$5,000 a month. Fifty hands are employed, forty of whom are young girls, the others being skilled workmen. Some of the girls have shown a remarkable aptitude in mastering the details of the business, and with a little more experience may be ranked as first class hands. Mr. James Leigh, the superintendent, has had many years experience in silk manufacturing, both in England and the Eastern States; and the machinery used in the establishment consists of the latest improved kinds. The silk used is from China and Japan, as well as California production. The company have used all the California silk they could procure, and have found it superior to the best Chinese and Japanese articles. They report the climate in this State well adapted to silk growing, and the California article is used by them, in making the finest grades of tram and organzine.

The great trouble California farmers have to contend with is, the difficulty of reeling silk from the cocoons; and we were informed that machines for reeling silk, if manufactured here, would have a ready sale, and be a great advantage to the silk growers. The silk manufactured at this establishment is a very fine article, meets with a ready sale, and has so far given satisfaction wherever used. All varieties of thrown silk are made, and the color of any sample can be matched in a few days in the dye house. Raw silk is at present worth from six to eight dollars per pound, according to quality. The starting of this enterprise has led to the establishment of a ribbon-weaving factory in this city; and other industries of a like nature would no doubt spring up, if a sufficient amount of silk was manufactured.

## The Golden State Iron Works.

These works have completed a furnace and condensers for the Phoenix Quick-silver Mining Company, in Pope Valley, Napa county; also the same articles for the Valley Mining Company, in the same locality. They are also making an engine, boiler and furnace irons for the Phoenix Silver Mining Company, of Nevada. They

are constructing a 15-stamp mill and Stevenson pans for the Metropolitan Mill and Mining Company, at Eureka, and are building Horn pans for the Original Hidden Treasure Company, at White Pine. They are also making a mill for the St. Patrick mine, at Newcastle, and hoisting works for the Oakland Paving Company. Shoes and dies are being turned out for quartz mills in Washoe, and distributing machinery for the Ellsworth Mill and Mining Company, at Ellsworth, Nevada. Mining cars are also being built for the Amador mine, Amador county.

## Eureka Foundry.

This establishment is engaged upon work for different gas works, including those of Los Angeles, Oakland and Petaluma. The foundry is likewise running on castings for outside machine shops.

## Meeting of the American Institute of Mining Engineers.

The third and a very successful meeting of the Institute of Mining Engineers has just been held at Troy, N. Y. The members were hospitably received by the citizens, and an address of welcome was given by the Mayor. The principal iron works and furnaces in that vicinity, and at Albany, were thrown open to the inspection of the members; and upon the invitation of the Port Henry Iron Company, they visited the celebrated iron mines at Moriah, in Essex County. The Bessemer steel works of the Messrs. Griswold; the new anthracite-burning iron furnaces below Albany and the extensive furnaces and rolling mills of the Messrs. Burden were visited in succession.

The sessions for the transaction of business, and the reading of papers, were held in the evenings in the Common Council Chamber, and were well attended by the members and others specially interested in the manufacture of iron and of steel. Most of the communications related to these industries, but there was one very valuable paper by Mr. Eilers (the assistant of Commissioner Raymond in the collection of mineral statistics), upon the Metallurgy of Lead and Silver in Utah and Nevada. Among other papers were the following: Manufacture of Bessemer steel, by Prof. Drowne; Late Improvements in Blast Furnaces, by Prof. Egleston; Iron Manufacture in the Lehigh Valley, by David Thomas, the President of the Institute; Electricity and Mineral Veins, by Prof. Raymond; Efforts to make Iron in Blast Furnaces in Japan, by Prof. Blake; Iron Deposits of Essex County, by Prof. Maynard; Description of Krupp's Steel Works, by Prof. Egleston.

Some or all of these papers will be published in a volume at the end of the year and will be distributed to the members. The place of the next meeting in February was not fixed upon, several places having been proposed, but will soon be decided upon by the Council. Among the new members elected were several gentlemen actively engaged as mining engineers upon the Pacific Coast.

CIVIL ENGINEER'S POCKET-BOOK.—We have received a small, neatly-bound volume entitled the "Civil Engineer's Pocket-Book," by John C. Trautwine, C. E. Although containing, in a condensed and convenient form, much that is of use to professional engineers and the more advanced student in civil engineering, the elementary principles of geometry, arithmetic, algebra, surveying, natural philosophy, mechanical engineering, etc., are very fully given. Among the subjects discussed are the strength of iron and wooden pillars, with full tables; trusses for roofs and bridges; weights of bars, bolts, pipes, etc.; stone bridges, culverts and arches; hydraulics, hydrostatics, railroads, locomotives; leveling, surveying; tables cubes, square roots, cube roots; traverses, sines and tangents; broad measure, radii and curves, logarithms, level cuttings, etc. It contains tables and rules concerning almost every imaginable thing—all comprised in 650 pages of small type. Among other things is a convenient glossary of technical terms. The work is published by Claxton, Remson & Haffelfinger, 819 and 821 Market street, Philadelphia.

**Freezing of Nitro-Glycerine Powders.**

As the season is upon us when most difficulty is experienced in using nitro-glycerine in any and all its forms, in consequence of its freezing, a few words of explanation and caution may be of service to miners and others.

It seems to be a settled fact that miners, for some purposes, will use some of the strong fulminates now known to science, of which there are many. Most of these fulminates are made wholly or in part of nitro-glycerine; this is a fact published by their manufacturers. But the nitro-glycerine is combined with other materials, which change it from a liquid to a solid, and render it safe to transport, and as safe to use as any other explosives.

It is not generally known that nitro-glycerine, in whatever condition, freezes at 42° Fahr., whereas water freezes only at 32°, and these powders become as solid as ice.

This is no damage whatever to the powder; as, while it is in a frozen condition, there is no decomposition and no escape of gases. But while it is frozen it has but little explosive force, and it must be thawed out before using, or the effect of the blast will be lost.

Many accidents have happened while these powders were being thawed out, occasions, perhaps, by want of knowledge as to the manner in which it should be done.

These accidents have occurred by persons exposing the powder near to a fire, or by placing it in a vessel and holding it in direct contact with a hot fire.

Nitro-glycerine, when exposed to a heat of 360° Fahr., will explode. Now, when one or another of these powders are exposed to heat in this manner, in a frozen condition, that portion of it nearest the heat will commence thawing; as the process goes on and the heat increases, that which lies against the heated surface of the vessel is soon raised to 360°, and an explosion must follow; and as by this time considerable of the powder will have become thawed, the explosion is likely to be very violent.

Such carelessness has already caused the death of two or three persons, and the maiming of several others; among the former an estimable citizen of Nevada county. This thawing out, however, can be done safely, the only requisite being to guard against raising the heat to 360° F.

The best method to do this is to place the powder in a tin vessel, say a lard can, or if a larger quantity is needed, in a kerosene oil can,—any deep vessel that will not leak—and set this in another containing boiling water, when the powder will soon be fit for use. This is conveniently done as most of these powders used are put up in cartridges. It is easy to determine when it is thawed, as the cartridge will readily yield to pressure between the thumb and finger.

By following this simple practice the heat will not be raised above 212° F., and no accident can occur by thawing liquid nitro-glycerine, or when in the condition of Hercules or Giant powder.

**GILLET'S FEDERAL GOVERNMENT.**—We have received through A. L. Bancroft & Co., from Woolworth, Ainsworth & Co., publishers, a copy of Gillet's "Federal Government, its Officers and their Duties." This work will be found useful to those desiring a general knowledge of the affairs of the Government, and will enable the rising generation to understand the structure of our Government, what officers are employed in its practical operation, and their general duties. Such knowledge will be found useful to all, especially to the American citizen when giving direction to our public laws. The work is handsomely bound, and contains 444 pages. It was written by Ransom H. Gillet, formerly a member of Congress, and more recently Register and Solicitor of the United States Treasury Department, counselor at law, etc. We mentioned the receipt of a copy of this work from A. Roman & Co. last week.

**Alabaster Cave.**

Among the many natural wonders of California, which excite the admiration of strangers who visit our State, is the famous El Dorado county cave, which was discovered in 1860 by Mr. William Gwynn, whose workmen were engaged in quarrying stone to build a lime kiln. The cave or grotto is not of very great size, but its chief attraction consists in the beautiful shapes and colors of the alabaster, which form the sides and roof. When brilliantly lighted up with torches, a most magnificent scene is presented to the gaze of the visitor. In one portion of the cave, the alabaster has taken the form of a pulpit, as shown in the accompanying cut, taken from Hutching's "Scenes of Wonder and Curiosity in California."

Mr. Gwynn, in a letter to a friend, thus speaks of this natural curiosity: "On our first entrance, we descended about 15 feet to the centre of the room, which is 100 by 30 feet. At the north end there is a magnificent pulpit, in the Episcopal Church style. It is completed with beautiful

THE PULPIT, IN THE ALABASTER CAVE.

drapery of alabaster stalactites, of all colors, varying from white to pink red; which overhang the beholder. Immediately under the pulpit is a lake of water, extending an unknown distance. On arriving at the centre of the first room, we saw an entrance to an inner chamber still more splendid, 200 by 100 feet, with the most beautiful alabaster overhanging us in every possible shape." Several apartments were discovered and named, respectively, Crystal Chapel, Dungeon of Enchantment, Julia Bower, and Picture Gallery.

**Recent Mining Discoveries.**

A rich gold-bearing quartz ledge has been discovered near the Eliza mine in Siskiyou county.

The discovery of rich placer mines on Rouge River, Oregon, 8 miles from Slate Creek, is announced.

A quartz ledge, that promises to be valuable has been found on Rock Creek, Nevada county.

INVENTORS will hereafter find Mr. J. M. Stockman, a pioneer model and pattern maker of this city, at the northwest corner of Natoma and Fremont streets, over W. T. Garratt's Brass Foundry, where he has every facility for turning out to advantage all work in his line.

**A New System of Cheap Transport for Side or Tributary Railway Lines.**

We have received a small pamphlet published by William B. Hyde, C. E. of this city, having the above title, in which the various systems of railroad transportation are reviewed. The author is the inventor of an improvement in the construction of cheap railway lines, and the intention of the pamphlet is to give to railroad men and capitalists a few facts and figures which will lead them to the same conclusion that induced the author to undertake the introduction of a new and improved system.

The inventor speaking of his improved plan says:

We require a railway which shall be able to sustain loaded freight cars from the parent road, at speeds of 5 to 6 miles an hour, and a special class of very light passenger cars, at speeds of 10 or 12 miles an hour, and a locomotive power so disposed as to haul the above without demanding a 45, 50 or 60 lb. rail for its service.

To accomplish this end I propose that very slight roadways be built as near the surface of the ground as possible within grades of 200 feet per mile, and with a superstructure of ties of 2½ in. x 8 in.,

usual length, surmounted by longitudinal rail stringers of straight Oregon pine or other good wood of 3½ in. x 6 in. deep, surmounted by a good strap iron, with ends spliced with an underneath fish-bar let into the surface of the wooden under-rail and bolted entirely through the same. Or a 10-lb., 15-lb. or 20-lb. iron T rail. With such a rail, the work which I have enumerated above, can be easily and safely done. Between the rails I construct a strip of flat roadway 18 or 20 inches wide at top, and which is about flush with the plane of the side rails. This strip to be manufactured of any material cheapest to the country in which the same may lie, be it stone or wood, asphaltum or McAdam. Upon this center strip of roadway will operate a broad elastic tire traction wheel, having just sufficient weight of the engine resting upon it to utilize every pound of steam that the cylinders receive from the boiler, permitting the remaining weight of locomotive to be so distributed by truck wheels as to bear upon the track very lightly and afford guidance to the locomotive. I make the center strip of equal heights with the side rails, so that at all junctions or switches the traction wheel can traverse without obstruction, from one track to another.

Mr. Hyde has procured Letters Patent for the above improvements in the construction of railway lines through the Scientific Press Patent Agency.

EDUCATION is a better safeguard of liberty than a standing army.

**PATENTS & INVENTIONS.****Full List of U. S. Patents Issued to Pacific Coast Inventors.**

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

**FOR THE WEEK ENDING NOVEMBER 21.**

EARTH-CLOSET.—Robert R. Strain, San Francisco, Cal.

SCHOOL DESK AND SEAT.—Wiley Watson, Visalia, Cal.

TWEER.—Alfred M. Worthing, Reno, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible by telegraph or otherwise at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

**Notices of Recent Patents.**

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

TWEER.—A. M. Worthing, Reno, Nev. The object of this invention is to provide an improved tweezer for blacksmiths and other forges, and it consists of a box into which the blast is driven, and from which it is delivered upon the fire through slots in the top of the box. The amount of air supplied to the fire is regulated by slides, which close the blast openings to a greater or less degree. In order to keep the whole apparatus cool, a water pipe is carried alternately through between the blast openings, and this prevents undue heating, and also keeps cinders from adhering to the fire surface.

IMPROVEMENT IN EARTH CLOSETS.—Robt. R. Strain, San Francisco, Cal. This improvement in earth closets relates to that part by which the earth is automatically taken from the hopper and deposited in the vessel below the seat; and it consists of a sliding frame or box, which is caused to move back and forward and receive a charge of earth from the hopper when the seat is pressed down by the weight of the occupant, and when the weight is removed the mechanism causes the box to be carried forward and deposit its contents in the vessel beneath the seat.

This seems to be a very complete, ingenious, as well as useful invention.

FARM GATE.—David Creighton, Vacaville, Solano county, Cal. This invention relates to certain improvements in automatic farm gates of that class which have one stationary and one movable pintle or hinge; and it consists in the employment of a double lever at each side of the gate, having one long and one short arm, and so connected with the operating arms and the bails in the road bed, that the long arm of one lever serves to open the gate to an approaching team, while the short arm of the other lever closes the gate after the team has passed. This is done by alternately moving the pintle at the bottom out of line, so that the gate will swing in one direction or the other, as the case may be. After having opened the gate, neither arm of the lever so doing can again move the gate till it has been closed by the other lever.

A DISTINCTION.—There are two authors of works on mining by the name of Phillips; and as the newspaper writings and reports of J. S. Phillips, of San Francisco, have been sometimes quoted as if written by J. A. Phillips, of London, it is but justice to both, and fair to the former, who is the writer of the "Explorers', Miners' and Metallurgists' Companion," the especially practical book, advertised in another column, that this should be remembered by our practical readers, for whom it has been expressly written.

WE HAVE received from Johnson & Co., No. 37 Sutter street, a little book entitled "Every Horse Owner's Training Manual, and Horseman's Guide," containing full and complete instructions in breeding, breaking, training, and educating the trotting horse, by C. Granville Johnston, among other things, it contains the new rules and regulation adopted by the National American Turf Congress.

# DOMESTIC ECONOMY.

## Kitchen Aids.

Mrs. M. E. Wager, talks as follows about the aids which every housewife should have to simply lighten her toils in the kitchen, which, when considered singly, appear insignificant; but which, in the aggregate, are so wearisome:—You are to make cakes or puddings, frostings or custards, and in heating and whipping your eggs you spend much time as well as strength. Here is a simple little affair—a wheel and a crank and some long loops of wires, which you can screw on the side of the shelf or table or hold over your bowl of eggs, by which you can heat your eggs to a perfect froth in one or two minutes, and with the utmost ease. The machine is called "The Egg Beater," and costs from seventy-five cents to a dollar.

You want to make toast for breakfast or tea, hurn your face and your hands, are a long time doing it, and find it such a bother that toast does not come on the table often. You can get a long handled toasting fork for fifteen cents, but a better affair for from twenty-five cents to two dollars and a half, according to size. This is made of wire, like a pair of hook covers, which opens. You lay in your slice of bread, rake out a bed of coals, hold it over them by its long handle and toast your bread on both sides, evenly and easily.

Here is a beef steak pounder for fifty cents. It is of cast iron, hatchet-like, with the bottom of the hammer checked with points, while the sharp edge of the hatchet will divide the meat as you like.

A housewife always has silks, yarn, worsteds or floss, which she knows will get in a tangle unless she winds it into a ball, or on a spool. A pair of chair hacks are often brought into requisition, or a child's arms made tired, if a man is not around to be utilized. Here is a little pair of swifts, opening and shutting like an umbrella, so that you can adjust them to any circumference you like. There is a screw to fasten it on the side of your work table and, when done using it, it folds up in a small compass, and is as much of an improvement upon the old fashioned swifts, that have such a dreadfully prosaic look, as a stove is an improvement upon a fireplace for cooking purposes. This "convenience" costs a dollar and twenty-five cents.

There is a pudding to be boiled for dinner, and the bag in which it is to be cooked is mislaid, or, if used, perhaps rips or tears, or gets untied, or burns on the bottom, and you hurn your fingers getting it out of the sack, as well as making a great muss when putting in the batter, or whatever is used; so that a boiled pudding is usually a dish seasoned with worryment and trouble. Let us show you this pudding boiler. It is of planished tin, melon-shaped, only the bottom is flat and fits in like a cover. You can pour your ingredients in this dish, put on the cover, boil until done, take off the cover and eat out your pudding on a platter, not only unburned but beautifully moulded. These are of various sizes, and cost from one to two dollars. Here is another style, a fluted, truncated, cone-shaped, with a tunnel rising through the center, insuring quicker boiling, and preventing rawness and heaviness in the middle, and is excellent for large puddings. This style of boiler ranges in price from a dollar and a quarter to two dollars and a half. You can have them in different designs, so that the pudding turns out with a mould of flowers, a sheaf of wheat, or ears of corn on the top. It is very nice, too, for moulding corn starch, or jellies, if you do not prefer the small separate moulds with beautiful designs, which vary in price from three to six dollars per dozen. It is one of the essentials of good cooking to have food look inviting. Anything that looks good and tastes good conveys a double enjoyment. It is like having your *vis a vis* at table, both handsome and agreeable.

Here is a saucepan for cooking milk, or rice, or mushes, which is so constructed as to prevent burning. It is simple, made of tin, and varies in price as in size, from seventy-five cents to three dollars.

In the summer time when farmers like something to drink more substantial than water, not the abominable stuff that comes from a bar-room, but a melange of ingredients, such as eggs, or milk, or jelly, or whatever may come under a temperate rendering of "nog," we have here a dish to make it in. It is of tin, tubular in shape, with the inside lined with sharp tin points. After putting in the ingredients and placing on the cover, a little vigorous shaking

amalgamates the mass beautifully. This "egg nog machine" costs thirty cents. So much for this time. Any contrivances or inventions our readers enjoy, pertaining to the domestic kingdom, we are anxious to have them tell us about. Why do not women develop into inventors?

## Filters and Filtering.

Water, wine, spirit, jelly, syrup, tinctures, and a great variety of other fluids, hot and cold, often contain substances which should be separated, in order to render the fluid clear and bright. As regards water filtering, it has become pretty general; but in domestic life there are fluids, such as wine, liquid jelly, syrup, etc., which are required to be made "clear" before they are put on the table. There are three kinds of filters—sponge for watery liquids, cotton for spirituous fluids, and wool for gelatinous fluids and oils.

In every well-appointed kitchen, there are tin or porcelain funnels. For filtering watery fluids it is only necessary to insert, in the choke of the funnel, a V shaped piece of fine sponge. All such liquids, on being put into the funnel, will pass through the sponge, and become quite clear. When this effect ceases, the sponge must be removed, and well elauded. Vicious fluids are best cleared by filtering through a cone of white blotting paper, shaped by folding a square piece of the paper from corner to corner, then folding the triangle into half its size, and opening the folds; it will fit any funnel, which will act as a support to the paper. Wines, etc., poured into this, will run through perfectly bright. In some cases where the wine is only a little thick from lees, cork, or other mechanically suspended substance, it can be made quite clear by filtering through a wad of white cotton put in the choke of the funnel; and when this answers, it is much quicker than the paper filter.

For jelly and oil, wool alone is the proper medium for filtering. The felted wool jelly bag is pretty well known as the heat means of clearing calves' foot jelly, and it also answers for olive and other oil. These bags are, however, too expensive to be generally used; hence they are rarely seen in kitchens. A good substitute for the wool bag is a colander, on the inside of which a new flannel lining, should be fitted, made of double stuff. A wad of white knitting wool, put in the choke of a funnel, will do to filter any small portion of such fluids. Many a good glass of port wine has been wasted for the want of a penny paper filter.—*Am. Manufacturer.*

## Mutton the Best Meat.

A great many tillers of the soil drag out miserable days, simply because they will persist in eating salt pork, hams and shoulders in spring and summer, when a dish of good mutton would give them new life and strength. We mean to repeat a thousand times, or at least till what we say has some effect upon our countrymen, that a pound of lean, tender, juicy mutton can be produced for half the cost of the same quantity of fat pork; that it is infinitely healthier food, especially in the summer season; and that those who eat it become more muscular, and can do more work with greater ease to themselves, than those who eat fat pork. We know nothing more delicious than smoked mutton hams of Southdown breed of sheep. Venison itself is not superior. By smoking a portion of the flesh of a sheep most families can dispose of the four quarters in an economical manner before any part of it would spoil.

**TO KEEP TOMATOES FOR WINTER USE.**—A correspondent sends the *Rural New Yorker* the following: As the tomato season is now here, I can contribute one way for keeping them for winter use that may be new to some of your readers. I ate them in February, sliced and seasoned with sugar and a little vinegar, that seemed every way as nice as tomatoes fresh picked from the vines. They were preserved in the following manner: Dissolve a teacup of salt in a gallon of water. Pick ripe tomatoes, but not over ripe, leaving little of the stem on. The tomatoes must be well covered with the brine, and they will keep till spring or over.

**TO TEST EGGS.**—The following comes from a housewife; of course in itself it is nothing new: Put the tip of your tongue to the broad end. This end is always warm, compared with the pointed end. If it feels cold, the egg is unmistakably bad.

If your potatoes are watery, put a piece of lime about as large as a hen's egg in the pot, and boil with them, and they will come out as mealy as you please. So says an exchange.

## Mechanical Hints.

**A WATER-PROOF CEMENT OR VARNISH.**—The Chinese make many kinds of water-proof varnishes, one of which is compounded as follows:—To three parts of fresh, beaten dehydrated blood and four parts of slacked lime, add a little alum, and you have a thin, sticking mass which is immediately ready for use. If applied to any ordinary wooden box or even to a common straw basket two or three times, the box or basket will be perfectly water and oil tight. A pasteboard box served with this preparation assumes the consistency of board and becomes water and oil tight. If this preparation is impervious to kerosene, its value would be very great. An experiment in that direction by coating the inside of casks might lead to important results.

**TESTING LUBRICATING OILS.**—Some ingenious inventor has contrived an apparatus to test the relative merit of lubricating oils. The point is decided by an indicator that registers the different degrees of heat produced by the action of the machinery during the test, the heat revealing the relative amount of friction, decides the merit of the lubricator used. The invention is to be patented.

It frequently happens that painters splash plate or other glass windows when they are painting the sills. Soda melted in very hot water and applied with a soft flannel will entirely remove the paint.

**VERY HARD CEMENT.**—Some repairs being required to the stone steps leading to a garden, a French mason used Portland cement mixed with finely divided cast and wrought-iron filings, and broken up horings, instead of with sand. The result has been that the mass has become so hard as not to admit of being broken either with hammer or pickaxe.

**WIRE ROPE** is more than twice the strength of hemp rope of the same circumference. Splicing a rope is supposed to weaken it one-eighth.

## Want of Decision.

A great deal of talent is lost to the world for the want of a little courage. Every day sends to their graves a number of obscure men, who have only remained in obscurity because their timidity has prevented them from making a first effort, and who, if they only had been induced to begin, would, in all probability, have gone great lengths in the career of fame. The fact is, that, in doing, we must not stand shivering on the bank, thinking of the cold and the danger, but jump in and scramble through as well as we can. It will not do to be perpetually calculating risks and adjusting chances; it did very well before the flood, when a man could consult his friends upon an intended publication for a hundred and fifty years, and live to see its success for six or seven centuries afterward; but at present a man doubts, and waits on his brothers, and his uncles, and his particular friends, till one day he finds that he is sixty-five years of age, that he has lost so much time in consulting first cousins and particular friends that he has no time to follow their advice. There is so little time for over-squeamishness at present that the opportunity slips away. The very period of life at which man chooses to venture, if ever, is so confined, that it is no hard rule to preach up the necessity, in such instances, of a little violence done to the feelings, and efforts made in defiance of strict and sober calculation.—*Sidney Smith.*

**A BEAUTIFUL THOUGHT.**—When engineers would hridge as steam they often carry over at first but a single thread. With that they stretch a wire across. Then strand is added to strand, until a foundation is laid for planks, and now the hold engineer finds safe footway and walks from side to side. So God takes from us some golden-threaded pleasure, and stretches it hence into Heaven. Then he takes a child, and then a friend. Thus he bridges death, and teaches the thoughts of the most timid to find their way hither and thither between the two epheres.

**LABOR.**—It is to labor, and labor only that man owes everything possessed of exchangeable value. Labor is the talisman that has raised him from the condition of the savage; that has changed the desert and the forest into cultivated fields; that has covered the earth with cities, and ocean with ships; that has given us plenty, comfort and elegance, instead of want, misery, and barbarism.

WE must stand or fall by our own actions.

## AUCTION SALE.

We will sell at public Auction, to the highest bidder for U. S. gold coin, on THURSDAY, December 28th, 1871 at W. A. Holcombe & Co.'s warehouse, the following described goods, to pay storage and advances, unless the charges are previously paid. Sale to commence at 12 m.:

Description.	Name.	Charges.
1 case.	R. Carpenter.	\$14 50
1 chest.	Do.	17 00
5 cases wire.	W. N. O.	23 00
1 bd sack.	Jacoby Roberts.	22 00
14 pgs furniture.	Smith & Smith.	45 45
1 bundle, 1 bedstead.	Francisco Garcia.	24 50
1 case.	A. H. Mow.	18 25
1 pgs frames, 1 ssab.	Marinette.	25 00
1 barrel.	A. B.	25 50
2 pkgs ore.	O. Phelps.	24 50
1 case.	H. Winfield.	26 50
1 keg.	Oeo. Landage.	27 00
1 case acid, 1 case.	S. D. Field.	31 50
1 marble slab.	Oodwin & Co.	27 25
435 quartz, 1 case.	C. Boman.	31 85
1 veloched.	Marinette.	30 10
1 sign, 2 cot beds.	A. Waldman.	27 40
1 trunk.	Mrs. Terry.	27 50
2 cases.	R. O. O.	27 75
1 bale.	Miss Silvers.	31 00
15 coils wire.	S. H. Hild.	55 75
1 sulky.	Oeo. W. Wells.	41 25
1 case.	Sam Lee.	29 75
1 case mdso.	C. O. Wecall.	30 50
1 chest.	Mar. Aret Terry.	31 85
1 case.	W. M. Seaby.	30 60
1/2 cask, 1 barrel, 1 case.	F. S.	10 35
1 case.	C. S. B.	30 50
6 pumps, 1 pk handles, 4 pg iron, O. M. Ganch.		61 25
1 case.	C. C. Hanson.	52 50
1 chest, 2 pieces pipe.	B. McOee.	31 00
1 case.	A. O. Wecall.	37 50
1/2 cask.	Oeo. Spect.	34 25
1 box.	Douglas & Co.	34 00
1 case.	S. Goldman.	35 25
1 box.	C. O. Hanna.	36 60
1 case.	R. W.	35 50
1 coil chain.	J. Moody.	35 50
10 1/2 barrels.	A. M.	57 00
Lot of iron shafting, etc.	J. A. Wall.	69 00
1 case.	A. Wall.	36 00
1 stove, 1 boiler, 1 bd. pots, 1st. pan, David Ruggles.		56 00
1 case.	C. E. Hensch.	28 50
5 cases, 1 trunk, 1 chest.	F. C. Warren.	35 00
1 case.	W. Terry.	22 00
1 chest.	W. F.	12 00
1 chest.	C. W. Worden.	16 00
1 trunk, 1 case.	E. R. Campbell.	63 10
1 trunk, 1 bd Bedding.	Mrs. Leley.	15 00
1 case.	No Mark.	12 00
2 pkgs bedstead, 1 bundle.	Mrs. Bowers.	15 00
1 show case.	J. A. Mahew.	33 00
1 barrel.	O. Glass.	34 00
1 case.	No Mark.	51 00

COBB, JONES & CO., Auctioneers.  
San Francisco, Nov. 25th, 1871. n-25-5w.

## MENZO SPRING,

Manufacturer of Dr. Douglas Bly's

## Patent Artificial Limbs,

S. W. corner Second and Jessie Streets, San Francisco

All other kinds changed and repaired. The late improvements on the Dr. Bly Limbs, especially his two best Legs (one with the other without lateral motion at the ankle joint), make them far superior to all other Artificial Legs in use. (See illustration of Anatomical Leg, No. 8, present volume).

For particulars call or send for circular. Circulars sent free. Address MENZO SPRING, 117-23-sa 101 Jessie street, San Francisco, Cal.

## LEA & PERRINS'

CELEBRATED

## Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester: Cross and Blackwell, London, &c. &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v22-1yew

delphia, ap8-ly

**CRAIG & BREVOORT'S**  
Patent Condenser for Steam  
PUMPS, &c.

NO. 1.

The annexed drawing represents a Condenser in-  
tended to be attached to the ordinary steam pump,  
thereby bringing it within the class of low pressure,  
or more properly speaking, of condensing engines; the  
steam, when it has done its work in the cylinder, in-  
stead of being exhausted into the atmosphere, is con-  
ducted to the condenser, on its entry into which, it  
meets the water drawn by the pump, and is immedi-  
ately condensed.

The Cut No. 1 represents a vertical section of the  
Condenser, and No. 2 an elevation.  
The flange D is bolted to the suction orifice of the  
pump, and the flange S to the pipe leading to the well,  
or whatever source of supply the pump may have; W is  
a water jacket surrounding the main chamber of the  
condenser, B, and with which the suction pipe, S, com-  
municates, permitting a free circulation of water within  
the jacket and into the hollow cover or top through the  
series of openings, one of which is shown at A, and  
from thence into the body of Condenser, B, through  
pipe P, carried by float F; the pipe P also acts autom-  
atically as a valve to enlarge or contract the space  
through which the water enters it, by which means the  
possibility of the condenser being at any time flooded is  
avoided. The pipe P, it will be observed, also acts as a  
guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or  
lowered by means of screwed stem—shown coming  
through elbow in Cut No. 2—is for the purpose of in-  
creasing or decreasing the flow of water according to  
the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into  
cover at E; the exhaust steam is thus thrown directly  
into contact with the water entering the condenser on  
its way to water cylinder of pump through D. A  
vacuum being of course immediately formed, acts on  
the exhaust side of the steam piston, aiding it in its  
work. If at any time it is desirable to run the pump  
without the condenser, it is only necessary to turn the  
three-way cock, which is placed in the exhaust pipe,  
into such a position as to cause the steam cylinder to  
exhaust into the atmosphere; when this is done the  
pump is perfectly free from the condenser, and acts as  
if it were not attached. This condenser is especially  
useful for pumps running in mines, or any other po-  
sition where trouble is experienced in getting rid of the  
exhaust steam. Address: H. L. BREVOORT,  
6v23-cowly 128 Broadway, New York City

 Capital stock, \$1,000 in 10 shares. Trustees:  
 Stephen Cooper, Sarschel Cooper and B.  
 Cooper.

**RUSSIAN RIVER WATER Co.**—Capital stock,  
 \$1,000,000 in 100,000 shares. Trustees: J. B.  
 Frisbie, F. D. Atherton, W. F. Babcock, M. S.  
 Latbam, T. Parrott, E. H. Green and A. de  
 Laski.

**SALINAS SKATING RINK.**—Capital stock, \$4,000  
 in 80 shares. Trustees: I. J. Hovey, J. B.  
 Iveson and W. Vanderhust.

**ALPINE GOLD MILL AND M. Co.**—Capital stock,  
 \$1,200,000 in 12,000 shares. Trustees: J. W.  
 Gasbiller, J. F. Boyd, C. N. Felton, T. H.  
 Morgan and T. M. Lither.

**SACRAMENTO CENTRAL CANAL Co.**—Capital  
 stock, \$10,000,000 in 100,000 shares. Trustees:  
 W. P. Dangerfield, J. W. Gregg and Thos. R.  
 Lowe.

**JUSTIN M. Co.**—Capital stock, \$2,100,000 in  
 21,000 shares. Trustees: R. F. Morrow, G.  
 Beaver, I. O. Thorn, G. W. Gordon and T. H.  
 Williams.

**DAVE CROCKETT SILVER M. Co.**—Capital  
 stock, \$800,000 in 1,000 shares. Trustees: W.  
 P. C. Stebbins, J. H. Wilcox, W. J. Williams,  
 J. E. Nutting and H. Baker.

**BOWERY CONS. MILL AND M. Co.**—Capital  
 stock \$3,000,000 in shares of \$100 each. Trus-  
 tees: L. J. Hanchett, H. Myers, N. C. Fasset,  
 J. Spear and J. D. Fry.

**BARTLETT'S SPRING AND BEAR VALLEY TOL-  
 ROAD Co.**—Capital stock, \$6,000 in 3 shares.  
 Trustees: T. B. Burger, J. C. Greenwood and  
 T. B. Penny.

**OUR BULLETIN-BOARD.**—The elegant and  
 unique bulletin-board, which we have  
 placed in front of our office this week, was  
 painted by F. Mansel, No. 412 Pine street.  
 Mr. Mansel is one of our best-known sign  
 painters, and specimens of his work may be  
 seen in all our principal streets. His signs  
 are always neat and tasteful, and his  
 charges reasonable.

**NEGLECTING THE STRAWBERRIES.**—The  
 strawberry fields about San José were so  
 unprofitable last season that one-third and  
 perhaps one-half the plants have been ne-  
 glected so that they died.

### The Scientific Press,

Established in 1860, is now the Largest, Most  
 Original, Best Illustrated and most Ably and  
 Carefully Edited Practical Mining Journal on  
 the Western Continent. Its contents are made  
 up of fresh intelligence in a condensed and inter-  
 esting style, easily appropriated by the reader,  
 who finds its columns replete with new facts  
 and ideas not obtainable in the books of the  
 past or in any one other of the journals of the  
 day.

Varied in its carefully compiled and con-  
 veniently arranged departments, representing  
 the special and leading industries of the Pacific  
 States—Mining, Mechanism, Manufacturing,  
 Building, Improvements and Inventions—it  
 becomes a weekly informant to all Scientific,  
 Mechanical, Manufacturing and Industrial  
 Progressionists on the coast, an immense list  
 of whom testify to its pleasant, profitable and  
 elevating influence.

The progress of our journal has been steady  
 and unvarying. Encouraged by a liberal  
 class of readers who exhibit their appreciation  
 in a substantial way, we shall, with our in-  
 creasing facilities, experience and information,  
 make each coming issue superior to its prede-  
 cessor.

Let every friend of Science and Industry on  
 this side of the continent take pride, not only  
 in sustaining, but accelerating the advancement  
 of a faithful representative of its highest inter-  
 ests by subscribing for it and urging its patron-  
 age by others—now, without delay.

Subscription \$4 per annum, in advance.

Address **DEWEY & CO.,**

Publishers and Patent Agents, 338 Montgomery  
 St., S. E. corner California St., S. F.

#### Our Agents.

Our FRIENDS can do much in aid of our paper and the  
 cause of practical knowledge and science, by assisting  
 Agents in their labors of canvassing, by lending their  
 influence and encouraging favors. We intend to send  
 none but worthy men.

W. H. MURRAY—General Traveling Agent.  
 A. H. DWINELEE—Special Corresponding Agent.  
 T. B. POWERS—Solana and neighboring Counties.  
 L. N. HOAG—Sacramento, General Agent.  
 F. M. SHAW—San Diego.  
 L. P. MCCARTY—California.  
 M. W. LEVY—Denver, Colorado.  
 M. B. STARR—Pacific Coast.  
 THOS. POTZER—California.  
 WM. J. CLARK—California.  
 T. W. DRULLMAN—California.  
 JOSEPH DIMMICK—California.  
 E. P. HICKS—California and Oregon.  
 A. C. KNOX, City Soliciting and Collecting Agent.

#### Our Printed Mail List.

Subscribers will notice that the figures found on the  
 right of the pasted slips, represent the date to which  
 they have paid. For instance, 21st/70 shows that our  
 patron has paid his subscription up to the 21st of Sep-  
 tember, 1870; 4th/72, that he has paid to the 4th of  
 January, 1872; 4th/73, to the 4th of July, 1873. The in-  
 verted letters occasionally used are marks of reference,  
 simply for the convenience of the publishers.  
 If errors in the names or accounts of subscribers oc-  
 cur at any time an early notice will secure their im-  
 mediate correction. Please notify us if you are not prop-  
 erly credited within two weeks after paying.

EVERY MECHANIC should read and familiarize  
 himself with "Brown's 507 Mechanical Move-  
 ments," illustrated, published and sold by  
 Dewey & Co., Scientific Press office, San Fran-  
 cisco. Bound in cloth. Price, (very low) post  
 paid, \$1, coin, or its equivalent in currency.  
 Inventors, Engineers, Students, and Apprentices  
 will find it exceedingly useful and especially  
 handy for reference.

COLDS AND COUGHS.—SUDDEN CHANGES OF CLIMATE  
 are sources of Pulmonary and Bronchial Affections.  
 Experience having proved that simple remedies act  
 speedily when taken in the early stage of disease, take  
 at once "BROWN'S BRONCHIAL TROCHES," let the Cold,  
 Cough, or Irritation of the Throat be ever so slight, as  
 by this precaution a more serious attack may be ward-  
 ed off. Owing to the good reputation and popularity of  
 the Troches, many worthless and cheap imitations are  
 offered which are good for nothing. Be sure to OBTAIN  
 the true "Brown's Bronchial Troches." Sold every  
 where.

Go to the Best.—Young and middle-aged men  
 should remember that the Pacific Business College is  
 the oldest and most popular and successful Business  
 Training School on this coast. Upwards of Three  
 Thousand Students have attended during the past six  
 years, many of whom now hold prominent positions in  
 the first banking and mercantile houses of this city.  
 This is the MODEL TRAINING SCHOOL FOR BUSINESS on the  
 coast, having the greatest corps of Professors and  
 Teachers, and the greatest number of Students at  
 tendance, of any institution of the kind. Young men  
 flock to this College from all parts of the Pacific States  
 and Territories, British Columbia, Mexico, Sandwich  
 Islands and South America. We shall be pleased to  
 send our College Circular, giving full information, to  
 all who send the address. When you write, mention  
 that you saw this notice in the Scientific Press.  
 M. K. LAUDEN, President, San Francisco, Cal.

GIVE YOUR OLD ADDRESS when you want the paper  
 sent to a new one. We cannot afford to look over sev-  
 eral thousand names to stop it at the former P. O.

CONTINENTAL Life Insurance Co., 302 Mont-  
 gomery street, corner of Pine.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company—Location of works, Grass Valley, Nevada County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 31st day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Beatty, Frank G.....	17	200	\$50 00
Beatty, Frank G.....	271	18	4 50
Cohn, L B.....	220	200	50 00
Cohn, L B.....	264	18	4 50
Dibble & Byrne.....	118	100	25 00
Dibble & Byrne.....	119	100	25 00
Dibble & Byrne.....	120	50	12 50
Dibble & Byrne.....	272	23	5 75
Dodge, D F.....	270	36	9 00
Orant, Emanuel.....	206	7	1 75
Hooper, Aaron.....	227	100	25 00
Hooper, Aaron.....	273	9	2 25
Jeffrey, E H.....	269	25	6 25
Murbar, Martin.....	222	200	50 00
Murbar, Martin.....	274	18	4 50
Pinkham, S.....	145	100	25 00
Pinkham, S.....	258	9	2 25

And in accordance with law, and an order of the Board of Trustees, made on the 31st day of October, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at No. 327 Montgomery street, San Francisco, Cal., on the 26th day of December, 1871, at the hour of 3 o'clock p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DANIEL WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. d9 3w

Eagle Quicksilver Mining Company—Location of Works, Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 20th day of October, 1871, an assessment of Forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any share upon which said assessment shall remain unpaid on Thursday, January 4th, 1872, shall be deemed delinquent, and will be duly advertised on Saturday, the 6th day of January, 1872, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. nov4d

Mina Rica Mining Company—Location of Works, Auburn District, Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 15th day of November, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 2, 414 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, the 18th day of December, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. R. SPINNEY, Secretary.  
Office, Room No. 2, third floor, 414 California street, San Francisco, California. nov18-5w

Nevada Consolidated Borax Company—Location of works, Columbus and Fish Lake Valleys, Esmeralda county, Nevada.

Notice is hereby given, that at a meeting of the Trustees of the above named company, held November 25th, 1871, an assessment of five (5) cents per share was levied on the capital stock of said company, payable on and after the 20th day of November, 1871, in U. S. gold coin, to the Secretary, at the office of the company, No. 420 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on Wednesday, January 10th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold at public auction on Monday, January 23rd, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. L. SANFORD, Secretary.  
Office—Room 1, 3d story, No. 420 Montgomery street, San Francisco, California. d9-5t.  
San Francisco, December 6th, 1871.

Ophir Copper, Silver and Gold Mining Company—Location of works, Ophir, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 23d day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Trustees, made on the 23d day of October, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of John Middleton & Son, No. 310 Montgomery street, on the 15th day of December, 1871, at the hour of 1 o'clock p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. G. BRUSH, Secretary.  
Office, 314 California street, San Francisco, California. d2-3w

Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 29th day of November, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 16, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. A. JENNINGS, Secretary.  
Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal. d2-3w

THE C-SPRING ROLLER SKATE,

PATENTED 1871.

Rights and Skates for Sale.

This superior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping Skate now before the public (except the Plympton Skates) that can run without infringing a former patent.

This Skate is Positively no Infringement

of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

START A RINK,

Should examine and test this Skate. Sample pairs sent C. O. D. on application.

For City, County or Rink Rights, call on or address  
21v23-tf  
WIESTER & CO.,  
No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.

HUGHES' PATENT

REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the hall to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

Address 1811 Sidney street, East Birmingham, Pa.

JOHN HUGHES.

## Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## DEWEY & CO., American and Foreign Patent Agents, Publishers of the Scientific Press, San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

### Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

### Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## THE PACIFIC RURAL PRESS

Is a Large and Handsomely Illustrated Agricultural Home Journal; Original, Instructive and Attractive; its varied contents are read with an interest that renders it popular with all its readers. It is a credit to the field it occupies, and to every intelligent circle it enters. ENTIRELY FREE FROM POLITICS, its columns are filled with cheerful words of encouragement for our Pacific Industries and instruction for the people. It will add to your information of the growing wants and necessities of our rapidly increasing and progressing agriculture. You can read it with pleasure, for present and future profit; you can send it with satisfaction to your friends anywhere. Its editorials are earnest and its contents reliable. No questionable advertisements darken its pages. It is a journal for city and rural hearths and homes throughout the Coast. Ruralists in the mining as well as farming districts should favor it with their countenance and patronage. Improved systems of agriculture mean cheaper subsistence, more comfort and greater prosperity to miners, mechanics and manufacturers. It is the advocate of a great industry, never before adequately represented by a handsome and popular home print. It is without a rival on this half of the Continent. Published in San Francisco, by DEWEY & CO., at \$4 per annum.

### General Analysis of Contents.

#### Section I.—GEOLOGY AND MINERALOGY.

CHAPTER I.—Formation of the Earth, from its initial chaotic state to the time of the partial elevation and solidification of its primitive granitic mountains.  
2.—Formation of the first clay slate, greenstone quartzites, hornblendes, and various fine-grained feldspathic mixtures, from primitive rock elements.  
3.—The rock formations of the Paleozoic, Mesozoic, and Cenozoic time; wherein the footprints and fossiliferous remains of animated nature unfold evidence of their presence and progressive continuance, from first mere existence to perfection.  
4.—Theory of Earthquakes; the mighty powers that have fractured some of the mineral sections of the earth's crust into separate belts of rock, within the opening walls of which the minerals have been since deposited.  
5.—Formation of Veins; of the "True fissure veins" in the Azoic and metamorphosed Paleozoic rocks. Of converging and wedge veins in the convex upper sections of upheaved bed-rock. Of veins that are more or less conformable to the general cleavage of tilted strata, in the seams of which the matrices, minerals and metals have been deposited. Of veins that intervene and separate two distinctly different strata, as granite and slate, slate and limestone, etc. Of cash veins. Of cross courses. Of slides. Of dikes. Of carbonates, honanzaes, pockets, and floors. Of irregular sublimations, alluvial distributions, and sedimentary deposits.  
6.—The supposed actions and reactions that have been and are continually taking place in mineral veins, pockets and deposits. How minerals were formed. How gold, platinum, and other similar metals were formed.  
7.—The peculiar characteristics of "True fissure veins" and their constituent combinations. Positions, directions, and dips. General compartmenting and traversing different strata, when forming intersections and junctions with each other, or with cross courses, dikes and slides. Counteractions and general influence of cross courses, slides, and dikes. Summary of the effects produced by collective causes.  
8.—The more generally recognized premonitory indications, in the shallow portions of veins, for probable increase of mineral in depth.

#### Section II.—EXPLORATION.

CHAPTER I.—Prospection.  
2.—How to explore.  
3.—Where to explore.  
4.—The peculiar kinds of the primitive and secondary rocks, that concern the miner, as being most congenial for rich veins; and what formations should be avoided.  
5.—The prospector's and locator's preliminary exposition of the exact features of a vein, so as to ascertain its approximate value, previous to location, and development by the miner.

#### Section III.—ASSAYING AND DISCRIMINATIONS.

CHAPTER I.—Systematic preparation of the sample, to obtain average equality, for discrimination or assay.  
2.—Description and general advantages of the "explorer's, miner's, miller's, and smelter's friend," the portable, "wee pet" assaying machine.  
3.—New methods for the examination and assay of ores, by water-washed concentrations, sometimes perfected by acid solutions, or mercury, and completed, when necessary, by roasting and fluxed fusion, with crucible, scorifier and machine.  
4.—The methods for discrimination, by blow-pipe or assay, in match of such of the metals, metallic minerals, and earths, with their combinations; that should be known by the explorer, miner, miller, smelter, assayer, and metallurgist.  
5.—Discrimination of the profitably useful minerals, by a new method, for practical men.  
6.—An alphabetically arranged record of the effects produced by water and fire, sometimes assisted by water and chemical re-agents, in the minerals and such of their compounds as will be practically useful and profitable to the explorer, miner, and metallurgist.  
7.—Assaying of gold and silver, by ten different methods.  
8.—Assaying of Lead.  
9.—Assaying of Antimony.  
10.—Assaying of Copper, by acids and by fire.  
11.—Assaying of Tin, by water, acids, and fire.  
12.—Assaying of Mercury.  
13.—Assaying of Iron.  
14.—Assaying of Manganese and Zinc.  
15.—Assaying of Coal.

#### Section IV.—MINING AND ENGINEERING.

CHAPTER I.—Education of a Mining Engineer.  
2.—Systematic and more extensive excavations, for the examination of the proposed rich vein.  
3.—Mechanical Engineering, above and below the surface.  
4.—The Cornish hydraulic engine; steam-pumping engine; pumps, etc.; hand and steam capstan, hoisting machines, tram-roads, and man engines.  
5.—Deep mining, as facilitated by such machines.  
6.—The Cornish crushing, stamping, fluming, jigging, huddling, franning, and roasting machinery.  
7.—Dry and wet concentration of ores, by hand, water, and acids; and by calcination.  
8.—Preparing and sampling the ores for the market, etc.  
9.—Contracts, setting, paying, and accounting.  
10.—The most important and more frequently recurring errors in mining, which may be more easily avoided than committed.

#### Section V.—METALLURGY.

CHAPTER I.—Roasting.—Roasting of peculiar ores, to reduce their weight for cheaper conveyance to the market.  
Roasting refractory milling ores. Roasting to obtain the volatile element, in marketable purity. Roasting preparatory to chlorination, or other chemical reduction. Roasting for regulus.  
2.—Milling.—By battery, with water and mercury. By battery, dry, for after treatment; by roasting and pan amalgamation, by chlorination with Plattner's process, or other chemical manipulation. Milling with iron pans; in copper-bottomed pans; in arstas; in the Chilian mill; and with close revolving barrels.  
3.—CHLORINIZING.—Plattner's original method. Furnace chlorination, etc.  
4.—SMELTING.—Smelting by natural draught, in reverberatory furnace. By blast in cupola furnace. By various extempore means.  
CHEMICAL REDUCTION.—By several of the best known methods.

VOLUME XXIII.  
Number 24.

## Improved Universal Wood-Working Machine.

Our illustrations represent an improved wood-working machine. Fig. 1 is the front side, and Fig. 2 the reverse side with "sticker" attachment to plane four sides. It is necessarily a somewhat complicated piece of mechanism, but being made of iron and steel, is not very likely to get out of order. The great variety of work which it is capable of performing, makes it a labor saving machine. It does all kinds of jointing, square or bevel; squaring; planing straight and out of wind, parallel or taper; straight, circular and elliptical moulding; panel-raising; plowing; rabbeting; cornering; beveling; tonguing and grooving; hard-matching; smoothing; beading; fluting; chamfering; rounding; nosing; sawing; boring, etc., and other similar work.

The machine will plane one, two, three or four sides at one operation, and is easily adjusted for all classes of work. The planer is eight inches wide, and the moulding machine puts through any size from a light to an 8-inch crown moulding. The panel-raiser varies and finishes one or both sides at the same time, for immediate use with square, bevel or moulded raise, and the jointer makes glue, rolling table and flooring joints. A round, bevel groove, or gain may be made from  $\frac{1}{8}$  to 8 inches wide, by the gainer, and will permit the use of a rip or cross cut saw twelve inches in diameter. A boring machine is also attached having an 18-inch sliding-table and 14 inches drop. On the routing table, bed, table and fence posts can be routed and round-ended mortises made. The radius planer (known as the Bumble-bee) planes wagon felloes, hounds, cart and drag shafts, etc.

In referring to the engravings we must necessarily omit many of the details and point out some of the principal features

in the general construction. In Fig. 1 is shown the vertical adjustment of the tables, an arrangement that is accomplished through the action of the inclined planes, *A*, simultaneously moved by hand screws, *C*. On these planes rest the in-

furniture factories, car building, wagon and carriage manufactories, etc. Among the many advantages claimed for it are the great variety of work it can perform; ease of adjustment; saving in time and labor; strength, durability and accuracy in per-

Moreover, since it is capable of working material from the rough and performing all the necessary operations to finish it, there is no necessity for the machine to stand idle. For further particulars concerning it, address McBeth, Bentel & Margendant, manufacturers of wood-working machinery, Hamilton, Ohio.

Fig. 1

clines, *B*, which support the table. *D* is a fence, made of iron and capable of being adjusted to any angle with the table. As

forming work; capacity of taking the place of several machines; power to plane light or heavy stuff out of wind and finish it at

they may be of interest to persons at a distance who are unable to attend. They will be found instructive as well as entertaining, as important scientific subjects will be discussed.

Fig. 2

IMPROVED UNIVERSAL WOOD-WORKING MACHINE.

will be seen in Fig. 1, there are two independent tables one on each side of the cutter head, so that the piece to be planed rests on a solid surface on each side of the cutter bits, and is thus planed out of wind.

The "sticker" side of the machine shown in Fig. 2, is provided with boring, routing and other kinds of work above specified.

The machines are used extensively in

the same operation; economy of bench work, and the fact that two workmen can operate to advantage at the same time, doing different kinds of work.

There is no necessity of handling wood frequently in a shop where this machine is used, for it does not have to be carried from one machine to another to undergo different operations, for by changing the heads of this appliance it is readily adapted to the kind of work required.

\$22 per ton on iron. Freights from the Pennsylvania coal mines have also advanced, and the Chicago fire has greatly increased the price of nails. The effect of these advances is being already felt in the working of the mines and upon business generally.

"EXPLORERS', MINERS' AND METALLURGISTS' COMPANION."—Titles of chapters, etc., of this new and valuable work will be found in our advertising columns.

## MECHANIC ARTS COLLEGE.

The first lecture of a course to be given before the Mechanic Arts College was delivered on Saturday evening in the hall of the Mechanics' Institute by Prof. Carr. A report of the lecture will be found in another column although a synopsis such as we have space to give does not do full justice to its merit. We will continue to report these lectures in the order that they are delivered, trusting that

RISE IN THE PRICE OF COAL.—The recent increase in the price of coal, as well as rise in freights from England, will have a marked effect upon various branches of industry immediately dependent thereon. The following will show the difference in prices: old rates—Lehigh \$19; Pittston \$14; Pig Iron \$27. Present rates—Lehigh \$45; Pittston \$33; Pig Iron \$52 and \$55. This advance has been caused by the coal strikes in England and Pennsylvania. Freights from England have gone up from \$12 to

# MECHANICAL PROGRESS.

## THE VARYING EVAPORATIVE POWER OF BOILERS.

Most engineers are aware that a wide difference exists in the evaporative power of boilers—that it often occurs that two boilers built as nearly alike as the same machinists can make them, of iron of equal thickness, and, to all appearance, alike in quality and character, will under the same apparent circumstances of fuel, etc., perform quite unequally. The fact, we say, is very generally acknowledged; but the cause why it is so is a matter which has never yet been satisfactorily explained. The explanations usually assigned for this relative difference in evaporative power, are imperceptible differences of construction, values of fuel, modes of firing, etc.

Quite recently Messrs. Storer & Whelpley, of Boston, whose names have lately been quite prominently connected with experiments in the use of pulverized fuel, have undertaken another series of experiments, designed to thoroughly test the facts named above, and the cause thereof. In a communication to the *Scientific American* those gentlemen say:

"In order to discover this hitherto unknown cause, a series of experiments was made, based on the supposition that the conditions which affect the conducting power of a metal for electricity—alloys and impurities—would, perhaps in equal degrees, affect its power for transmission of heat.

Nine pieces of boiler plates of different brands were selected for the purpose of the experiment; they were of uniform thickness (five-tenths of an inch.) Some of them were samples of locomotive fire-box plate; and the others of boiler plate.

They were tested for their heat transmitting and steam generating efficiency, with the following results: Allowing the plate of lowest transmitting power to have a value of 100, we have

1	Power of transmission.....	100
2	" " " " " " " " " " " "	104.5
3	" " " " " " " " " " " "	117.7
4	" " " " " " " " " " " "	118.8
5	" " " " " " " " " " " "	121
6	" " " " " " " " " " " "	123
7	" " " " " " " " " " " "	123.3
8	" " " " " " " " " " " "	141.9
9	" " " " " " " " " " " "	144

It must be distinctly understood that these transmitting powers were measured by the generation of steam under equal and similar conditions. Each plate was subjected to a number of trials; the temperature of the flame to which it was exposed varying, during each series of trials, but a very few degrees from 550° Fahr., and the time of evaporation of the water but a few seconds.

The ratios of values have been calculated according to the tables for such purposes prepared by Dulong. The experiments have been conducted by Mr. Charles E. Avery, of Boston, a gentleman thoroughly competent by scientific and practical knowledge for the undertaking of such delicate work.

In order to discover and avoid all sources of error, the apparatus and method finally adopted for these determinations were first subjected to the test of weeks of most careful experiment.

To generate an equal amount of steam in equal times and with similar conditions of fuel and draft, boilers made of Nos. 8 and 9 plates would consume constantly 40 per cent. less fuel than boilers made of plates Nos. 1 and 2.

Insomuch, therefore, as their efficiency in the production of steam is vastly greater than that of the inferior plates, the commercial value of these plates will be still greater in proportion. The possibility of a daily economy of 40 per cent. of fuel should induce boiler users to purchase the best plate, and boiler plate manufacturers to exercise more care in its manufacture.

Some of the most considerable variations in evaporative efficiency were found between plates from the same manufactory.

No analyses of the iron of the plates have been made, it having been assumed that the comparative presence or absence of slag or glass—a poor conductor of heat—was the chief cause of the determined variations; though, doubtless, carbon and other elements will be found to exercise decided influences. These we propose to determine; and other points of novelty and interest in regard to boiler plates have been decided, which we hope at some future day to give to the public.

With our method of firing (our application of pulverized fuel to the generation of steam,) which almost entirely eliminates other causes of variation, we had

found one boiler to have an evaporative efficiency of nearly 60 per cent. more than another. Hence the search for the unknown causes of variation.

This is not the only instance in mechanics where such unaccountable differences have been observed. Musicians have observed that, of two violins as nearly alike as human skill can make them, one may be a valuable and the other a comparatively worthless instrument. Those who have studied the art of violin making attribute the difference in tone to unexplained peculiarities in the wood from which these instruments are made. \* \*

But while we are willing to concede that the quality of boiler iron may greatly effect its power to transmit heat, we think the difference in quality which produces such a result will be found to be mechanical rather than chemical, as Messrs. Whelpley and Storer would seem to think in their remark on the effect of alloys and impurities. At least we have no doubt that molecular conditions, not dependent upon chemical affinity, do effect the conducting power of metals both for electricity and heat.

It is certain that in many instances molecular structure has much to do with conducting power. Wood conducts heat with far greater facility in the direction of the grain than across it. Crystals are well known to exhibit similar variations, in conducting power, relative to the direction of their axes. Conduction is also known to be effected by the conditions of homogeneity or non-homogeneity.

Now as iron is more or less crystalline in structure, according to the thoroughness with which it has been worked, and the presence or absence of foreign materials, we are of the opinion that some of the variations observed by Messrs. Whelpley and Storer may be referred to the arrangement of these imperfect crystals of fibers in the plate, and perhaps to certain approaches to lamellated structure, consequent upon defects in manufacture.

Whatever their cause, if the differences be thoroughly established, they are of the utmost practical importance, and we trust the investigation thus begun will lead to such a general examination and discussion as will throw more light upon the important subject of economical steam production.

**RELATIVE VALUE OF BRICK VAULTS AND IRON SAFES.**—The Chicago fire has done much to exhibit the relative value of iron safes and brick vaults as places for the safe keeping of valuables. While the safes were comparatively worthless, the vaults generally preserved their contents in a perfect condition. Of course the condition of the safes was due more or less to the intensity of the heat to which they were exposed. Some safes came out all right, while others of the most improved manufacture, when opened, contained nothing but charred remains or a handful of cinders. There is not a safe in existence that could have withstood the ordeal in certain localities. Some of them, heretofore considered indestructible, were cracked asunder and the contents prematurely destroyed. The exterior walls are like so much rusty iron, and will chip off in great flakes, while the interiors of more than one of the larger safes were for some time after the fire so warm one's hand suffered when placed in contact with them. The conclusion unavoidably arrived at is that the best iron safe is not near so safe as a properly constructed brick vault.

**A SIMPLE RAILWAY PRECAUTION.**—To prevent a Revere disaster on their line, the managers of the Fitchburg Railroad, in Massachusetts, have provided their station-masters and flagmen with six-minute "hour-glasses." When a train passes, the glass is turned, and if a train approaches before the sand has run out, a red flag is displayed and the train stopped. As soon as the sand has run out the glass is turned again, and if a train comes before the sand is down, two flags—red and white—are shown, which indicate "proceed with caution." Afterward, a white flag shows the track is clear.

It is proposed to introduce a new telegraphic service in the German army for artillery in action. Experienced artillerymen are to be posted under cover far in advance of the batteries to watch the effects of the cannonade, and report back by means of a small portable telegraphic apparatus.

COLONEL H. YULE stated at the British Association meeting a short time since that the oak timbers which bound the walls of the palace Ctesiphon, in Babylonia, dating from the fifth or sixth century of our era, are still undecayed.

# SCIENTIFIC PROGRESS.

## Surface Movements of the Earth.

The old geological theory that from time to time the surface of the earth has been changed by grand catastrophes which, destroying plants and animals, were, on an immense scale similar to the local catastrophes produced by volcanic eruptions and earthquakes, has been abandoned by reasons of our more correct knowledge, founded on careful observations which investigators have been making for many years. These observations have proved that sudden catastrophes are always merely local; but that all the great changes in the surface of our earth, as the upheaval of mountain ranges and the depression of valleys and their ultimate change into lakes and oceans, are gradual and go always on, even at the present day.

The mountains bordering the Pacific Ocean, in fact the whole coast of California, are perpetually rising, and have probably been doing so for half a million of years, while all the land containing in its bosom our great American lakes is slowly sinking, with a probable corresponding upheaval of the State of Kentucky, of Southern Indiana and surrounding countries. Geological investigations prove that once our lakes had their outlets south, till by depression at the north a new outlet was formed, about forty thousand years ago, through Niagara to the St. Lawrence River. The division line of the lakes and the Mississippi Valley has been slowly traveling southward since that time; and when the city of Chicago recently turned the waters of Lake Michigan up the Chicago River into the Mississippi Valley, she simply re-established the old state of affairs, which, if the motion in question continues, will be more difficult to maintain in the future than it is now. Fortunately, this motion is very slow, and only a very remote posterity, some thousands of years hence, will meet with the difficulties we now foresee, and the head of the Chicago River becomes lower and lower in its junction with Lake Michigan.

It appears, further, that the State of New Jersey is sinking, and this is even participated in by the City of New York, Brooklyn, Long Island, etc., at the rate of some sixteen or seventeen inches per century. This is insignificant, to be sure; but let it only go on for a thousand years and it is some fifteen feet, so that the new stone docks now commenced in New York City at that time will be totally submerged; but then they will not probably last so long, and the soil of the lower part of the city may be very easily raised half a foot every thirty years. It is evident that the most correct data may be obtained at the sea shore, as the main height of the ocean possesses a perfect stability. This main height is, of course, obtained by continual observation of the tides under different circumstances, and if anywhere the highest tides reach a higher level than they did one hundred or two hundred years ago, it is a proof of depression or sinking of the land.

This depression is going on along the coast of Northern France, Belgium, Holland, and northwest Germany, while the coast of Sweden, along the Baltic, is slowly rising, including the capital of Sweden, the city of Stockholm.

The latest scientific journals report two very striking contemporary upheavals in Spain, entirely authentic. M. de Botello describes them in detail, and the most curious fact is that the short time of scarcely a quarter of a century was sufficient to produce an effect which has surprised every inhabitant who observed the circumstances formerly, and compared them with the present condition. In the province of Jarama, it is observed that from the village of Villar Don Diego, it is now possible to see the upper hall of the church steeple of Remiñares, in the province of Valladolid; whereas, twenty-three years ago, the summit of the steeple could only just be perceived. The same thing occurs to the same degree and under the same circumstances in the province of Alava, where from the village of Salvatierra the whole of the village of Saluende can now be seen, while in 1847 the vane of the church steeple could be hardly perceived. These four points are on a line parallel to the system of the Santerrois Mountains, while the extreme points are one hundred and forty miles apart.

All the movements we speak of here have nothing to do with volcanic eruptions; they are, of course, caused by changed conditions of the interior of the earth's mass, which by these facts is proved not to be

solid, the opinion of some modern geologist notwithstanding; the earth, if not liquid inside, must at least be soft and plastic, in order to make depressions in one place with simultaneous elevations in another.

One other interesting fact we must mention in this connection; it is that the highest mountains are not the oldest, as one would naturally suppose, but belonging to the system last elevated; so that the high Swiss Alps are much younger than the lower Shawangunk mountains.—*Exc.*

**AN INTERESTING EXPERIMENT.**—Dr. Chandler, in a late issue of the *American Chemist*, sketches an interesting experiment based upon the reduction of metallic silver from the nitrate. When solid nitrate of silver is placed upon glowing charcoal, deflagration takes place, the result being that the silver is left behind in the metallic state. The curious phenomenon attending the reaction is that the nitrate, being fused by the heat of the chemical action, sinks down into the pores of the coal, and as each particle of the latter is replaced by the reduced silver, the structure of the original wood is retained.

Dr. Chandler states that he has succeeded in this way in producing masses of silver weighing an ounce or more, which show most beautifully the rings of annual growth in the wood. The author directs that a crystal of the nitrate be placed on the end of a stick of charcoal, and the blow-pipe flame directed upon the coal beside it to start the reaction. As soon as the deflagration sets in, crystal after crystal of the nitrate may be added to keep up the supply.

**NEW MODE OF PREPARING SULPHURETTED HYDROGEN.**—This gas, a common reagent in many chemical operations, may, it is said, be conveniently generated by heating a mixture of equal parts of sulphur and paraffin (or with a larger proportion of sulphur) in a flask to a temperature not much above the melting point of the sulphur—sulphuretted hydrogen will be evolved with great steadiness. The author recommends the process as the most convenient of any yet devised for laboratory use. Where a pound of material is used in a suitable generating vessel, the evolution of gas may be prolonged for several days with great regularity. The production of the reagent can be stopped and renewed at pleasure by withdrawing or applying the lamp.

**INTERESTING ASTRONOMICAL DISCOVERY.** Professors Harkness and Hale, of the Washington Observatory, have lately succeeded in obtaining a spectrum of Encke's comet, now rapidly approaching its perihelion. The lines obtained indicate that the substance of this comet consists of a glowing cloud of gas—of what elements composed we are not informed, or indeed whether the spectrum showed it to consist of any of the elements known on the earth. The fact of the gas being in a highly heated condition, however, instead of existing at a comparatively low temperature is of itself an interesting fact—if such has been shown.

This comet is evidently undergoing great changes in its physical condition, as in 1829 it was seen with a light—intensity of 1.2. In 1868 it had a light of 2.2. On the 13th of October last, its light was 10. The present is about the most favorable time of its orbit to observe it, as it reaches its perihelion on the 29th of this month.

**CEMENT TO RESIST SULPHURIC ACID.**—Take caoutchouc; melt this by gentle heat; add from 6 to 8 per cent. of the weight of tallow, taking care to keep the mass well stirred; add dry slaked lime, so as to make the fluid mass the consistency of soft paste; and, lastly, add 20 per cent. of red lead, whereby the mass, which otherwise remains soft, becomes hard and dry. This cement resists, according to Dr. Wagner, boiling sulphuric acid. A solution of caoutchouc, in twice its weight of raw linseed oil, aided by heating, and the addition thereto of an equal weight of pipe-clay, yields a plastic mass which also resists most acids.—*Chemical News.*

**FELDSPAR ARTIFICIAL STONE.**—A new artificial stone is shortly to be introduced into the market, composed of feldspar or feldspathic minerals (previously vitrified), quick-lime, and flint. Hydrate of lime, it is claimed by Dr. Ott, will slowly replace the soda or potash of the feldspar, forming a compound like Portland cement. This reaction is accelerated by the presence of flint, which, according to Fuchs, contains soluble silica. The latter ingredient has a strong affinity for the alkalis of the feldspar.

## CORRESPONDENCE.

### Mines at Radensburg, M. T.

During my stay at Radensburg I visited the town of Keatingsville, about two miles distant, where the principal mines of this district are situated. It is a quartz camp, although there are a few placer claims, which are paying well.

#### Iron Clad.

This lode has been traced for over a mile on the surface. The shaft is 150 feet deep. There are two drifts running north and south from the bottom of the shaft, 130 feet. The lode will average  $2\frac{1}{2}$  feet in width, and is well defined. The ore, containing iron sulphurets, averages \$25 per ton, and there are 250 tons on the dump. The country rock is blue granite. With the most improved machinery the ore would yield a much larger per cent., but at present the milling facilities consist of arastras and copper plates. The hoisting is done by means of a horse whim, but steam-hoisting works are to be erected in the spring. This mine is owned by Mr. C. G. Hollback, a very energetic, public-spirited gentleman, and one who is much liked by all in the vicinity. Mr. Byron Ballard is foreman. The next mine I visited was this one owned by the

#### Nave Bros.,

on the same lode. I went down the shaft 100 feet to a level, and went south 150 feet. I found the miners busily at work. The ore is of the same character as that mentioned above. Mr. Nave informs me that from 20 to 50 per cent. of the gold is lost by the rude process by which it is worked.

#### The Ohio Lode,

owned by Blacker and Keating, has two shafts, the main one 80 feet deep. A tunnel has been run in 200 feet; the ledge averages four feet in width, and is one of the most promising mines in the district. They have been extracting ore for the last ten months.

#### The Keating.

I visited this very valuable property in company with the foreman, Mr. George Richards. The main shaft is 165 feet deep, and the other 130. Passing down to the second level, we go into the drift, a distance of 550 feet. The average width is 40 inches. They have run in on this lode, north and south, 1,300 feet, showing that it is a continuous vein, with well defined walls. I noticed that the ore changes in character at a depth of 130 feet. It is a decomposed quartz for that distance, easily milled, and from that depth the shaft passes through sulphurets ore for 45 feet. At this depth it is seven feet wide. From the surface down it has continued to pay, on an average, \$25 per ton. The northern portion of this lode carries more gold than the southern end. They extract 30 tons of ore daily, which is run through the company's 15-stamp mill. The mine has paid 50 per cent profit, over and above milling and mining expenses, since it was first discovered. The company intend, in due time, to put up the requisite machinery for working this class of ore profitably. The mine belongs to the pioneers of the district, Blacker and Keating. The results of the workings of the lode appear frequently in your "Mining Summary." Fifty men are employed by the above gentlemen in the development of their properties.

#### Placer Mins.

About 500 yards from this property is a small cañon, in which is located the claim of R. Thompson. During the week that I visited the place, \$5,000 were said to have been extracted from this claim. Being immediately below the ledges, it is evident that it owes its richness to the gradual decomposition and disintegration of these veins.

#### The Left-hand Lode.

In the first level, which is run at a depth of 60 feet, a splendid body of ore is uncovered. Two shafts have been sunk 150 feet apart, and are well timbered. From above the two levels, 600 tons of ore have been stowed out, which milled about \$35 per ton. The average width of the vein is two feet, and it shows throughout plenty of free gold. It is expected that at a greater depth the vein will widen out to three feet, as the real foot-wall is fully that distance from the hanging wall. Between

the foot wall and the casing, rich seams of ore are traced, one of which is three inches thick. This fine ledge is owned by Judge Clancy.

#### Allen Lode.

The shaft on this lode is 110 feet deep, and drifts have been run 400 feet. There are now 1,000 tons of ore on the dump, 50 tons of which, when worked, yielded 42 ounces of gold. There are many other locations in this district, among them the Washburn, Pennsylvania and

#### Tennessee,

which is located between the Keating and Ohio lodes, on the east slope of the hill. They are down 15 feet on a two-foot crevice. The ore is a decomposed quartz, and prospects well.

There are three small mills in the district, and Mr. J. F. Allen is building a new 6-stamp one, with a 10-horse power engine.

W. H. M.

### The Resources of Montana.

EDITORS PRESS:—From my observations here I am satisfied that stock-raising and especially the wool business is destined to be the future great industry of Montana. The bunch-grass, which grows in such luxuriance as to lose, in some places, its characteristic distribution in bunches or clumps, and to cover the whole surface with continuous pasture, is famous as a nutritious and fattening food for stock. Cattle and horses are turned out upon it at all seasons, even in the winter, and improve in condition while grazing. This grass dies early, but retains its nutritious properties all winter. It thus constitutes a standing hay—only it is much better fodder than hay, and almost like grain in its effect. There are a good many horses in the Territory now and more attention is given to breeding; and in a few years this Territory will furnish, I am convinced, a stock of serviceable blood, worthy of the great advantages Nature has bestowed upon the stock-raiser here.

The grass to which I have alluded makes excellent beef also. The herds in some of the valleys amount to 5,000 or 6,000 head. There is a great demand still for oxen as well as cows; and Montana is importing cattle, as well as receiving into her ample grazing lands the stock of other States and Territories.

It is estimated, that 20,000 head of cattle and other stock were imported into Montana this year. They tell me that they have not had to feed their cattle during the last three or four winters. They thrive and grow fat on bunch-grass, as do the buffalo of which it is calculated there are at least 100,000 in the Territory. Beef here at present is worth 25 cents per pound.

#### Sheep and Wool.

There is no better country than this for raising sheep, and this business is being engaged in quite extensively. Messrs. Poindexter & Orr, of Beaver Head Valley, recently shipped to the railroad at Corinne, 13,000 lbs. of wool. This firm are the leading stock-men of the Northwest, and their vast herds show superior classes of cattle, horses and sheep. Mr. Ed. Larabee, a stock-grower in Deer Lodge county, has purchased 1,400 head of sheep and will engage in sheep-raising extensively. Mr. David Pattee arrived in Deer Lodge last week from Oregon, with a drove of 2,500 head of sheep which he purchased in that State. The sheep business is one of the most remunerative in the Territory, and Montana promises in a few years to be one of the first wool-producing regions on the Pacific slope.

#### The Climate.

The climate of Montana is delightful, and in winter as well as summer the air is pure, dry, healthy and exhilarating. There is no fever and ague or other diseases incident to damp and changeable climates. The mean annual temperature is the same as that of Pennsylvania, and the mean elevation of the valleys of the Territory is not over 2,500 feet. The fall of snow is not over half the annual fall in New England.

#### Altitude of the Principal Towns.

Helena is 4,300 feet above the level of the sea; Fort Benton, 3,000; Virginia City, 5,400; Deer Lodge, 4,000; and Missoula, 3,300.

#### Timber.

One-fourth of the area of Montana is well timbered and the supply is inexhaustible. It consists principally of white and yellow pine, hemlock, fir, cedar and cot-

ton-wood. There is no hickory, oak, beech or maple.

#### Building Material.

There is an abundance of blue and white limestone, sandstone and fine marble. Good clay for bricks is abundant, and fire clay is found in many localities. Bituminous coal of good quality has been discovered all over the Territory.

#### Agriculture.

All the cereals grow to perfection and the vegetables are not excelled anywhere. The climate is also well adapted to the growing of hemp. The soil is dark, vegetable mould, of great richness and fertility. The subsoil is a clay or clay mixed with sand, and is very porous without being epongy. The value of farm products of Montana for the year 1869 aggregated \$3,925,000, of which amount the wheat crop gave \$900,000, barley and oats \$500,000 and potatoes \$1,000,000. Strawberries, gooseberries, raspberries and currants grow wild in the valleys and along the borders of the streams.

#### Irrigation.

Irrigation here is a necessity for the raising of full crops. The method adopted is to get the wheat into the ground as early as possible in the spring, and turn the water on, when the grain is about four inches high.

#### Mining.

Mining is the chief business of the country. There are some 40 quartz mills in the Territory, erected at a cost of over a million dollars. Placer mines, however, yield the greater proportion of the gold production, and capital to the extent of several millions has been invested in ditches, flumes and hydraulics. Copper, iron, lead and cinnabar have also been found in paying quantities.

#### Railroads.

The early completion of the Northern Pacific Railroad, which is now a conceded fact, will do more to open up the resources of the Territory than any other improvement. The railroad which will be constructed from Ogden on the Central Pacific north, will also develop a rich region of country and inaugurate a new era of progress in Montana.

W. H. M.

### The Ogden Tin Bubble.

EDS. PRESS:—In your edition of the 25th November, when referring to the reputed tin discoveries at Ogden, you show commendable caution in not implicitly accepting the reports so industriously circulated; for all but a few fanatics are now satisfied that no such metal as tin has up to the present time been discovered in Utah. You express a desire to see some of this notable tin-bearing rock, but really, gentlemen, the question is not what to send you, but what not to send you, for all kinds of rock, syenites, schists, gneiss, elvanite, zinblend, hornblend, magnetite and even red hematite have been hawked about town not only by ignorant agriculturists, but by men whose education should have taught them better, and called tinstone. The extent of the excitement and the long continued credence given to the false statements of designing speculators, made your correspondent think for a time that perchance a small percentage might exist in some of the rock and that from want of knowledge poor samples had been selected and shown to him; so to satisfy himself he called upon a well-known notary public interested in the discoveries, who produced a piece of rock-syenite from the famous Star of the West, and a bar of metal, solder, said to have been extracted from rock similar to that exhibited and he was informed that chemists in Washington and New York had found by analysis in samples sent to them as much as 70 per cent. of tin. When that quantity or even the compromise 30 per cent. was called in question on account of the low specific gravity, and other physical characters of the syenitic rock, the mild suggestion was made that "the experience gained in other parts of the world was useless and inapplicable in this." The joke is too good to be lost. For the idea is certainly original that the laws of nature in monarchical countries cease to exist in countries under the rule of free and enlightened republican governments. He further heard of another new and startling property of tin, one which was particularly dwelt upon to ac-

count for the non-success in finding tin of the assayers throughout the country; which was, that tin sublimed at a temperature of 230° Fahr., and that assayers using a heat greater than this—silica, recollect, present—had sublimed the tin. But the secret of the means employed to raise the cry which bye-the-bye did not raise the wind, remained to be divulged by the original locator the i-tin-erant Dr. W., who, on finding his little game unsuccessful, acknowledged that pulverized solder was slyly mixed with the powdered rock, and to keep the globules which formed on heating from oxidizing, bacon fat or resin was added and called this flux. And now that the "ham-fat man" has gone south, let us hope, with his departure, both hard and soft solder have returned to their proper duties and that we have heard the last of tin at Ogden.

H. E.

### Sage Brush Ashes a Fertilizer.

Something may be learned sometimes where least expected. In the Humboldt Valley, living at one of the old stage stations, four or five years ago, was a family who made a fine garden from year to year, around the station. Sage brush growing large and vigorous was all the resource for fuel.

The wife desiring to cultivate a few vegetables and try the experiment of growing strawberry vines, had the soil broken close by the house, and while sitting out her plants found that a portion of the same had become mixed with the ashes that had been thrown there. She became dubious about the welfare of the plants, and set the most of them on a portion of the ground free from ashes; but having a few left, and not wishing to throw them away, she set them, with no expectation of seeing them live, where the ashes were mixed with the earth.

As the season advanced, the plants thrived, blossomed and bore fruit; but the few set out as she called it "in the ash bed" produced amazingly, and far excelled the others in quantity of fruit.

The next year the same family planted a large area of ground to vegetables, and to try the experiment, scattered the ashes of the sage brush which they had been saving all winter, plentifully over the soil. The result was larger vegetable and greater quantities than they had ever raised before. This may be an important fact to those who are clearing up the sage brush land preparatory to its cultivation.

The above furnishes another evidence of that which has long been foreshadowed that the large tracts of land in Nevada, Idaho, and elsewhere, that produce an abundance of sage brush to the exclusion of almost everything else, may yet bring forth an abundance of vegetable and cereal products, and be found to possess all the qualities of soil necessary to make them a paradise for farmers.

Along the banks of the Truckee are found many flourishing little farms, and from year to year the sage brush disappears and the progress of cultivation leaves its footprints in soil that has been considered unproductive and useless. Strawberries especially are found to be well suited to this soil and climate. The much despised sage brush may be found to be useful in more ways than one yet.

### Los Angeles Walnuts.

The first English walnuts were planted in Los Angeles county in 1857. They commenced bearing in three years, the crop increasing every year. In the year 1863 the crop amounted to 9,200 pounds. Previous to 1860 the walnuts used in California were all imported from China and Chile to the amount of nearly 30,000 pounds annually.

The flavor of the walnuts raised in Los Angeles is finer than that of the imported nuts. Near San Gabriel, or the Gabriel Mission, the walnut tree is found of larger size and bearing the best of nuts. These trees were set out by the missionaries. Los Angeles county supplies a large demand for walnuts, and as Southern California becomes more settled, walnut trees will be grown more extensively adding an increased resource of wealth to this delightful portion of our State.

# MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**RICH STRIKE.**—Alpine Miner, Dec. 2d: During the week a very rich strike has taken place in the Exchequer mine. Native silver, may be seen all through the rock. The strike is so valuable that the Manager thinks of putting the old mill on Silver Creek in better order and keeping it running through the winter.

### AMADOR COUNTY.

**NEW STRIKE.**—Amador Ledger, Dec. 9th: A rich strike was recently made in placer diggings in the vicinity of Drytown that bids fair to be remunerative and lasting.

**LITTLE AMADOR MINE AND MILL.**—This mine is being rapidly developed; the main shaft is down nearly 400 ft., and still progressing. The ledge is well defined to the lowest depth reached, and the rock taken out in sinking is rich. The mill connected with the mine, will be completed and ready for crushing about the middle of January.

**PAUGH MINE.**—Work is being vigorously prosecuted. The main shaft has been sunk 100 ft., deeper, and the rock taken out in sinking looks remarkably well. The ledge is well defined, with all the indications of a paying mine.

### BUTTE COUNTY.

**COARSE GOLD.**—Butte Record, Dec. 2d: We were shown, the Chief, dry a large and valuable specimen of coarse gold, taken from claims in the vicinity of Forbestown. Another large specimen weighing 78 was picked up last week in the claim of Hunter, Clopperhaven & Co., on Ohio Flat. This Co., also cleaned up in 2 days run 50 ounces.

### LASSEN COUNTY.

**PROVIDENCE MINE.**—Sage Brush, Dec. 2d: D. Knoch, of Susanville received \$10,000 in retorted gold dust, on the 22d ult., the result of one week's run by the Providence Co.'s mill at Hayden Hill. As the mill has but 2 or 3 stamps, the ore must have been very rich.

### NEVADA COUNTY.

**NORTH SAN JUAN.**—Nevada Transcript, Dec. 9th: The claims of Davis, Bower, Beach, and others are paying well. These claims embrace a large portion of San Juan hill, and are among the best.

The claims known as the Dutch Co.'s on the west end of San Juan hill, idle for 3 years have started up again with good prospects.

Should there be a wet winter the old Wisconsin company will commence washing.

The claims of J. Billings, on the south side of the Middle Yuha river, are being put in good trim for washing this winter.

**SEBASTOPOL.**—The American Co.'s claims are paying splendidly. A large tunnel is being rapidly pushed into these claims which, when completed, will be able to carry through it almost every foot of gravel from where they are now washing, clear to the town of Sweetland, distant 1½ miles. There are 50 men employed.

**PRITTSBURG MINE.**—We learn that this mine is yielding as well as ever, while it is improving in character as development progresses upon the ledge.

**NEVINS & Co.**, who operate on Lost Hill have their pipe all laid and turned on water last Friday.

**QUARTZ LOCATION.**—J. McLaughlin and others comprising the Pine Grove Co., have located 18 claims of 100 ft., each, on a quartz ledge on Cincinnati Hill, in a northerly direction from Rocky Bar, in Grass Valley township.

**COMPLETED.**—The new engine, battery and stamps, to be added to those in use at the Pennsylvania mine have been completed, and full work will be resumed immediately.

**BUCHANAN MINE.**—A crushing of 20 tons of quartz made at the Oriental mill, was cleaned up on Saturday, and yielded \$26 to the ton. The Buchanan ledge is a short distance above the Oriental mill, near Deer Creek.

**BUCKEYE CLAIMS.**—These claims, situated about three-fourths of a mile from the town of Sweetland, are panning out as well as ever.

**OMEGA.**—Tully, Hinds, & Kidd have about 2,400 ft. of pipe laid, and will use 1,800 inches of water. Fuller, Pease & Co. have about 1,000 ft. of pipe down, and will run 750 inches of water. Evans & Co. have about 600 ft. of pipe down and will use about 600 inches of water. S. Kyle has about 500 ft. of pipe laid and will use about 500 inches of water.

**LOCATIONS.**—The Grecian Bend Co. has located 1,000 ft. on a ledge about 4 miles from Grass Valley, on the east bank of Wolf Creek.

Peck and others have located 10 claims of 100 ft. each near New York cañon.

Lyons and others have located 10 claims of 100 ft. each below where the road crosses New York cañon.

**NEW YORK HILL MINE.**—Grass Valley Republican, Dec. 9th: A contract was let yesterday to miners for working the fourth level of the mine.

**MANHATTAN MINE.**—About 30 tons of rock have been hauled to Ben McCauley's mill at Boston Ravine. The last lot from the Manhattan averaged \$37 a ton, and the present lot promises to do still better. The ledge is about 15 inches thick.

**EUREKA MINE.**—Grass Valley Union, Dec. 6th: Gold valued at \$19,000 was yesterday shipped from the Eureka, for 2 weeks run. The mill has been running with all its 30 stamps.

**HOPE GRAVEL MINE.**—The Hope mine, for Nov., took out \$10,000 worth of gold, and the expense for the same period amounted to \$2,500.

### SAN DIEGO COUNTY.

**BULLION.**—San Diego Union, Dec. 3d: There was shipped yesterday to S. F., bullion amounting to \$4,130, from Julian and Banner Districts.

### TRINITY COUNTY.

**DOUGLAS.**—Cor. Trinity Journal, Dec. 9th: Marshall, Reed & Co. are driving through the hill, and are making fair progress. The tunnel is in nearly 500 ft., which leaves about 300 ft. yet to be completed.

McWilliams & Foley are fitting up a claim on Union Hill and will work a place where but little prospecting has yet been done. On the opposite side of the gulch, Brannan & Henge will re-open an old claim which was laid up for want of dumping ground 10 years ago. The claim paid well at the time and there is good ground left in it yet.

### TULARE COUNTY.

**WHITE RIVER.**—Cor. Visalia Times, Dec. 2d: Biggs and McNulty are taking out good pay rock on the Sarah Tucker lode. Mr. Mulby is running his claim and taking out rich rock. Mr. James is building an 8-stamp mill. He intends incorporating on the Warsaw the Clinton and extension of the Josephine. These are 3 large well defined lodes, cropping out boldly. They are in a slate formation, and have well defined walls. One of them, the Warsaw, crops 4 ft. above the ground and shows free gold. The other 2 show gold plentifully and pay well.

### TUOLUMNE COUNTY.

**GRIZZLY MINE.**—Sonora Democrat, Dec. 9th: The prospect is splendid for large yields in the future. For considerable time work was prosecuted for the purpose of finding the lead that was thought to be dipping to the north, but it has recently been found dipping toward the south. A vein 6 ft. in width is now exposed.

## Nevada.

### COPE DISTRICT.

**MOUNTAIN CITY.**—Elko Independent, Dec. 9th: The El Dorado is yielding richer ore than ever before, at 100 ft. deep, while the quartz taken out of the Excelsior at a depth of 130 ft. is "disfigured" all over with native silver and horn silver and the richest of black sulphurets. Most of this ore assays over \$100 per ton. The developments made in the Excelsior tunnel and shaft, indicate that the rich chimney extends not less than 400 ft. on the ledge. It is very rich at a depth of 130 ft. The quartz coming out of the El Dorado shaft is roughly "contaminated" with silver sulphurets and pyrites of iron carrying silver, much of it being very rich in silver with gold in quantities, at least \$10 or \$15 per ton. The El Dorado is about 5 ft. wide and the Excelsior about 3 ft.

A new ledge, the Sophia, has been discovered on the north side of California Creek, about 75 ft. below the St. Nicholas, and the locators have sunk on it 25 ft. It is a 2-ft. ledge and the very finest of silver sulphurets are thoroughly disseminated through the ore.

The owners of the Independent have a large shaft house erected and a hoisting whim, and are prepared for operations through the winter. At a depth of 125 ft. the ore is as rich as ever and large quantities are in sight in the drifts.

Operations on the Monitor, Kanawha, Emmett and some other rich ledges are suspended for the present.

**PENNSYLVANIA COAL MINE.**—This mine is about 20 miles northeast from Elko. A vein of coal 4 ft. wide was first struck in a shaft at the depth of 8 ft. from the surface. Since then a tunnel has been run for 200

ft., cutting, in the space of 100 ft., 5 distinct veins of different width—amounting in all to 60 ft. in width of coal resembling the best of Rocky Mountain coal.

**LUCRN.**—A smelting furnace of the most approved style has been completed and is running out bullion. The blast was put on yesterday, and the result of the first 21 hours' run was 21,600 lbs of bullion.

The Tecoma mine is looking better than ever, and is in shape to yield sufficient ore to keep the furnace running.

The Jeremiah Thompson, at a depth of 28 ft., shows a 7-ft. vein of ore which is sacked for shipment as fast as it is taken out.

The Lucy Emma has a shaft 100 ft. in depth, and at that depth shows a vein 6 ft. in width, of dark gray carbonates and crystallized galena ore, and bids fair to rival the Tecoma.

The Helen, at a depth of 35 ft., shows 6 ft. of good ore.

Roberts & Small own a claim which at a depth of 44 ft. shows a clay seam 4½ ft. wide, and a seam of ore 3 ft. in width. The clay is sold at \$4 per ton on the dump of the mine.

The Kentuck, at a depth of 17 ft. shows a vein of solid high grade ore 3 ft. in width.

### EUREKA DISTRICT.

**WILL START UP.**—Eureka Sentinel, Dec. 6th: The Pinto Mill will be ready to go into operation next week.

**LEMON MILL.**—Mr. Crandall informs us that he will get the Lemon mill ready for operation on or before Christmas.

**SHUT DOWN.**—The reduction works of the Eureka Cons. have closed down for a general clean up and overhauling. They will not fire up again until this first of the month.

**MINERAL HILL.**—The new mill of the Mineral Hill M. Co., just completed, has been compelled to shut down, after a successful run of 4 days, in consequence of some part of the furnace giving away.

**LOOKING WELL.**—The new developments on the Gen. Lee Cons. are looking better. In shaft No. 2, at the north end of the mine, the ore is 3 ft. in width, and widening as depth is attained. It is of high grade.

**GEN. LEE CONS.**—We visited this property on Sunday last, and found the various developments along the main lead much improved in the showing of ore since our former visit. In addition to the tunnel, open cuts and other workings, 3 new shafts have been started, and 2 shifts of 10 men are driving on them satisfactorily. From the initial point of the Ozark location, north to the top of Adams' Hill, a distance of about 800 ft., the continuity of splendid high grade milling ore has been demonstrated. The 2 new shafts are in excellent ore, and the ledge is constantly widening and improving in appearance as depth is attained. It seems probable that the northern portion of the vein is more valuable than the mammoth fissure disclosed further down the hill in the tunnel and other workings near that point. One of the new shafts is down 15 ft. and the other 8 ft. The ore obtained from both is of a superior quality. The supply appears abundant.

### ELY DISTRICT.

**BULLION.**—W. F. & Co. shipped since Nov. 30th, 57 bars valued at \$93,607.98.

**NO. SEVEN.**—No. Seven, of the Meadow Valley, is now the deepest shaft in the Dist. By the incline, it is down 497 ft., following the ledge, which stands nearer vertical as a greater depth is attained.

**WASHINGTON & CREOLE** are down 133 ft. and have drifted both ways the entire length of the claim, following the vein all the way through rich rock. A whim house, 34x60 ft. is being erected over the shaft.

**RAYMOND & ELY.**—Over the Lightner shaft, of the Raymond & Ely mines, is being put up, the first engine for hoisting ever erected in Pioche. The boilers are 12 ft. in length and 36 inches in diameter with two 18 inch steam drums on top, connected with mud drums of the same dimensions at the bottom.

**MOLKE MINE.**—This claim in Spring Mt., near to the Desdemona and Ivanhoe, is looking well throughout. The main shaft is down 100 ft. perpendicular, and still sinking. The indications are flattering as depth is attained.

A new discovery called Chief of the Hill, has been made near the American Flag mine. It has been sunk upon to the depth of 5 ft. and makes a pretty good showing.

**ONEIDA.**—We were shown some very rich rock taken out of this mine at a depth of 73 ft. The mine is a short distance east of the Lightner shaft.

**INGOMAR.**—In the shaft now sinking a body of chloride was struck at a depth of 150 ft. on Friday last. The mine is about 300 ft. west from the Lightner shaft. The

owners are very hopeful, one of them refusing \$1,000 for 50 ft. The ore struck is of a very rich character.

**NEW MILL FOR THE RAYMOND & ELY.**—The machinery for the new 30-stamp to be erected by this Co., arrived at Bullionville a few days since. This will give the Raymond & Ely Co. 50 stamps—30 more than at present.

### HUMBOLDT.

**BULLION.**—Unionville Silver State, Dec. 9th: The amount shipped from the Arizona mine, since our last issue, was \$6,384.

**ORE.**—The Eclipse M. Co. are delivering 10 tons of ore at the Pioneer mill, for reduction.

**UNIONVILLE.**—Cor. Humboldt Register, Dec. 9th: The mines have never looked so well as they do now, and new discoveries are being made in this Dist. There are 4 mills running night and day, 2 of which are working tailings. The Arizona mine is being well developed, and continues to show large quantities of black sulphuret ore all of which is shipping rock. They have 18 men at work. The new tramway is a complete success, and is a great saving. Its length is 1,900 ft.

The Eclipse mine is in about 100 ft. in the side of a large mountain, from the main tunnel, and still continues to drive ahead. The vein is 4 ft. wide, and of the same grade as the Arizona. Three ft. of this ore is good for shipping, and the remainder for milling. The Co. have 4 men engaged.

The owners of the Peru mine are engaged in driving a drift 70 ft. long, at which point they intend to strike north and south on the ledge. D. Van Lennep, of this place, has bought of the Peru Co., 30 tons of ore on the dump, at \$25.00 per ton.

### REESE RIVER.

**GOOD ORE.**—Reese River Reveille, Dec. 4th: The owners of the Sabrook mine have had another crushing of ore. It was worked at the Manhattan mill. The first class yielded \$1,400 per ton and the second class returned between \$300 and \$400. This rock was found at a depth of about 130 ft.

**BULLION FROM THE METACOMB MILL.**—We saw this morning at the banking house of Paxton & Co. 5 bars, 374 lbs., valued at \$4,987.32 from rock from the Pacific M. Co.'s Mine.

**MONITOR ORE.**—Sixty tons of fine ore from the Monitor mine, Belmont, is being worked at the Manhattan mill.

**BELMONT BULLION.**—W. F. Leon, Agent for the El Dorado South mine, shipped to the Bank of Cal. during Nov., 63 bars, valued at \$29,632.03, all from the El Dorado South.

**MORGAN AND MUNCEY MINE.**—The Manhattan Co. have come into possession and set to work to repair damages and to give it a thorough and systematic working. The machinery will be ready to start up about the first of next week.

**BULLION FOR NOV.**—W. F. & Co. shipped during Nov. 135 bars, 11,195 lbs. of the value of \$122,868.19. With the exception of 5 bars, it was all from the Manhattan mill and the Stetefeldt mill at Belmont which has been leased by the El Dorado South Co.

### WASHOE.

**BULLION SHIPMENT FOR NOV.**—Virginia Enterprise, Dec. 8th: There was shipped from W. F. & Co.'s during Nov. 534 bars, 39,832 lbs., worth \$905,022.69.

**BELCHER YIELD.**—During Nov., 5,700 tons of ore were sent to the mill from the Belcher mine. The ore at this mine is looking well, and assays from \$70 to \$100 per ton. Calling the yield \$85 per ton, the total yield of the mine for the month named would be \$483,500.

**KENTUCK.**—This mine is yielding well and is keeping a couple of mills going though they are working day shifts only. The Co. shipped \$6,212.82 in bullion last week.

The Savage mine yielded 2,783 tons of ore, assaying \$31.70 per ton, or a total of \$78,221.12, during Nov.

**CONS. VIRGINIA.**—Work is still progressing. Drifts are being run both to the north and south, but as yet no paying ore has been found.

**RESUMES.**—The Ramsdell & Thompson mill, on Gold Cañon, below Gold Hill has again started up. It goes to work on ore from the Woodville lead, a promising vein which crosses Gold Cañon under the Pacific mill, and which from the first has yielded paying ore.

**CARSON MINT.**—During two and a half days—Saturday, Monday and Tuesday forenoon—there was received at the Carson Mint over 4 tons of bullion; valued at upwards of \$350,000.

The thorough ventilation of the Crown Point mine has been secured by con-

necting the 3 lower levels by means of winzes.

#### WHITE PINE.

**BULLION FORWARDED.**—White Pine News, W. F. & Co. shipped to New York 11 bars 655 lbs., valued at \$11,056. Also for the Eberhardt & Aurora M. Co. 3 bars of bullion valued at \$3,962.52.

**GLACIER.**—As the Great Basin M. Co. intend suspending operations for the winter, we paid a visit to this mine. The Osborn shaft is about 60 ft. deep, following a spar seam, with more or less ore throughout. At 25½ ft. from the surface there are 3 drifts: the first is 23 ft. in length, running north, and shows a body of ore averaging 2½ ft. in thickness and 20 ft. along the drift. At the end of the drift there is a second drift 22 ft. in length running through vein matter, and along the north side throughout its entire length is the wall which, from its dip and strike and general appearance, is deemed to be a continuation of the well known north wall of the Eberhardt. The third drift, running southeast 15 ft. in length and 7 ft. below the level of the above named drift, shows a continuation of the same rich ore body. The Miller shaft is sunk to a depth of 55 ft. and at a depth of 30 ft. there is one drift running in a westerly direction into a large chamber, showing a breast of ore on the west side about 30 ft. in length and 8 ft. in height, from which a large quantity of first-class ore has been taken. The ore last taken out averages \$175 per ton. The Slauson shaft is 25 ft. in depth, and at the bottom has 2 drifts—one running north 15 ft. through vein matter, and the other running east 32 ft. showing a body of ore 2 ft. in thickness throughout its length. The ore from the blast and cut averages \$200 per ton. They have about 230 tons of assorted high-grade ore, and several hundred tons of low grade ore on the dumps.

**EBERHARDT.**—Work in the open cut was again interfered with by the weather. The Keystone drift from the shaft is going ahead and shows an improved appearance in the face.

**SILVER WAVE.**—Fleming is pushing work ahead with energy. The Lyford shaft is down 60 ft. and through the spar seam. The thickness of the spar seam at this point is about 16 ft. An incline has been started to follow the seam. The Perkins shaft is down 30 ft. No. 4 shaft is down 110 ft. on the foot wall and running east.

The indications at this point are favorable. The men in the Chenoweth shaft are cross-cutting for the purpose of tapping a solid body of ore matter ahead.

**ASBURY TUNNEL AND WORKS.**—The main tunnel is in over 300 ft., and the indications are improving as headway is made. The 2 side drifts are looking well.

**SAN JUAN DEL RIO.**—This mine is in Mahogany Cañon, not far from the Eberhardt. Capt. Boyle, the Supt., will commence operations on Monday.

**EAST SHEBOYGAN.**—A new strike was made this week in the face of the South original tunnel; also in the bottom of the East Exchange incline. A force of 26 men is employed, nearly all of whom are sinking and drifting to make connections. All the workings of the mine are improving in appearance.

**NOONDAY.**—The body of ore in the breast has increased since last mention. A crushing at the mill averaged \$114 to the ton.

**EDGAR.**—The drift which has been going ahead from the 110-ft. shaft has already cut through 40 ft. of ore and ledge matter. As yet the thickness of the ore-body is unknown.

**SOUTH AURORA.**—There are 2 shifts now at work in the main tunnel, making fair headway.

**ICEBERG.**—The whole force of men, with the exception of those employed on top, are breaking down ore in the breasts.

**OUTSIDE DIST.**—SCHELL CREEK RANGE. El Capitan, Sweepstakes, Excelsior and Nutmeg, have been purchased by Col. Sidney, who is in New York perfecting arrangements for erecting a mill and opening the mines.

**ROBINSON DIST.**—The furnace started up on ore from the Springfield, Carbonate and Freeborn mines, running through 70 tons of ore, from which 12 tons of bullion were obtained. The Badlam, Altovido, Lamb and other mines are showing well as far as opened.

#### Arizona.

**PINAL MINES.**—Tucson Citizen, Nov. 25th: The Silver Queen ledge is 4 ft. wide. It contains copper, antimony and silver, but more than half silver. The owners have sunk a few ft. deep on the ledge and find ore improving. Thirty men are out there prospecting and making discoveries every day.

**MINES AND MINING.**—Arizona Miner,

Nov. 25th: Except on the Tiger lode work has been suspended for the present, and will not be renewed until spring. On the Tiger, however, 8 or 10 men are still at work drifting and tunneling at the bottom of the principal shaft.

Nearer Prescott much activity is being evinced, in the work of opening up new discoveries. Kelly, Alexander and others, in Walker Dist. 8 miles from Prescott, for the past 3 weeks, have been sinking on the Cornucopia, Prescott, Bismarck and other lodes. Mr. Vorseley 5 or 6 weeks ago, effected a conditional sale of one of the above-named ledges, in S. F.

A party of men are preparing to sink a shaft on the Benjamin lode Walker dist.

**WALLAPAI DIST.**—The Lone Star mill, commenced work on the 10th. The ore was from the Lone Star lode.

A new ledge which promises rich, has been discovered in the Wallapai mountains, 30 miles from Mineral Park, and 16 miles from Beale's Springs.

Clarke & Co., about the 1st inst., shipped 5 tons of ore to S. F., which yielded \$2,200 to the ton.

#### Colorado.

**SHIPPED.**—Colorado News, Nov. 30th: The Stewart S. R. Co. have shipped for the week ending to-day 6 silver bricks valued at \$5,762.40, and also 4 lead bars valued at \$924.40.

We learn from Col. Gray that he has crushed, sampled and sacked, at the mill of the Trenton G. and S. M. Co. Silver Plume, during Nov. 40 tons of ore worth 668 ozs. per ton. The Silver Plume mine is looking remarkably well, and selected samples of ore taken yielded in London 3,054 ozs. per ton.

We have been favored with a sight of the certificate of the Stewart S. R. Co. of a mill run of Napoleon first and second class ore that yielded as follows: First class ore, 440 ozs. and second class ore, 105 ozs. per ton. The average yield of the crevice is therefore 292½ ozs. per ton. The crevice is large and averages from 10 to 12 inches of pay material. In drifting out the ore treated at Stewart's, the yield has been at the rate of \$8 per diem per man.

**LA CROSSE TUNNEL.**—Central Herald, Nov. 29th: The tunnel is 930 ft., into Quartz Hill. The last 100 ft. has been through an immense vein of low grade ore, running at an average rate of about 2 ozs. of gold to the cord.

Ore from the Trojan mine, Grand Island yields 8 ounces in gold to the cord. A quantity from the Boulder Co. lead was expected to yield 10 ozs. in gold per cord.

**B. S. BUELL** is successfully working the Illinois mine, which is yielding very rich ore. He will soon let contracts for the winter for sinking and drifting. Only smelting ore will be raised for some months; the mill ore will be left until spring.

**H. B. GROSE**, just returned from the so called tin mines at Ogden pronounces them a humbug. He brought samples of the ore, but Prof. Burlington and Von Shulz, on assaying, find it to contain no traces of tin.

#### Idaho.

**BULLION.**—Silver City Avalanche, Dec. 2d. W. F. & Co. shipped from here yesterday 3 bars, valued at \$4,713.95.

**MINING RECORD.**—Since our last issue 2 rich strikes have been made in the Golden Chariot—one in the 5th level about 340 ft. south of the shaft; the other at the bottom of the shaft in the 8th level. Last Thursday we visited the mine, and found the vein, just struck in the 5th level, to be nearly 2 ft. wide, with a pay streak from 18 to 20 inches in width of fine looking ore. In the 8th level, the ledge is 2 ft. wide, similar in character to that found in the 5th, fairly glistening with gold and silver. An immense body of rich ore exists between the 5th and 8th levels, south of the shaft.

The Elmore mill is cleaning up its run on tailings, after which it will crush a small lot of Mahogany ore. When that is done the mill will commence crushing ore from the South Oro Fino, now yielding from 15 to 18 tons per day—about 400 tons being now on the dump. Rich gold bearing ore is being found in the shaft at the south end of the claim which is down 70 ft.

The 7th level of the Elmore mine, 75 ft. north of the shaft, is yielding a fair quality of ore. The mine is being prospected in several other places, and the late strike in the Golden Chariot will encourage the Elmore Co. to resume sinking the main shaft. The Minnesota shaft is down 214 ft. and the Supt. will continue sinking it all winter. There are about 75 tons of ore at the mine which will be crushed in a few days and is expected to pay \$50 per ton.

The Mahogany shaft is down below the 4th level. After the shaft is well down, it is proposed to open up the 4th level and

get it ready for stoping out ore by the time that the shaft is down to the 5th level.

The ore in the lower level of the South Chariot has been improving in quality for the last few days. In the first level the ore is rich, but the vein too small for profitable working.

#### Montana.

**ELK CREEK.**—Deer Lodge New North West, Nov. 25th: The mines have closed down for the season. The claims of Kennedy & Co., M. Dooley and P. Brogan, above Yreka, were the only ones running this week, and they suspend to-day. They have splendid ground and have been making \$50 per day to the hand. W. W. Jones & Co. Plume Co., shut down the 16th, with good banks and good prospects for a successful run next summer. There are about 75 men in and about Elk, the most of whom will remain over winter.

**SLUICE-BOX ROBBING.**—On Saturday last, 3 boxes on the claim of J. Rodgers, Pilgrim Bar, were robbed. It is estimated the thieves got \$800. There were still \$800 remaining in the boxes. No clue to the perpetrator. Water was turned out of the Rock creek lake ditch on Monday. Mining is suspended. Yamhill almost abandoned, and Pike's Peak has relapsed into wintry somnolence.

**NEW SILVER LODE.**—Helena Herald, Nov. 30th: D. H. Gilmour is the discoverer of another silver lode which promises to attract attention. The lode has been opened, at one point, a number of ft. from the surface, and has been traced for 600 ft. The mine is some 5 miles north of Helena, and produces argentiferous galena of a rich quality.

#### Oregon.

**THE NEW DIGGINGS.**—Oregon Sentinel, Dec. 2d: We learn that the new diggings on Rogue River, 5 miles below the mouth of Applegate are prospecting well.

#### Utah.

**BULLION.**—S. L. Tribune, Dec. 7th: W. F. & Co., forwarded on the 3d, to New York, 9 bars, from the Meadow Valley Works, worth \$9,986.25, and received on the 5th, 10 bars worth \$10,314.95 from the same place, also for shipment to New York. On the 6th, they received 17 bars, 2,600 lbs. valued at \$50,700 from the Raymond & Ely, to be forwarded to New York.

**EMMA.**—A new deposit of ore has been struck of a high grade.

The 24-stamp mill being erected at Homanville, Tintic Dist., is expected to be ready for operations within 30 days.

**STAR DIST.**—The Sheandoah, is turning out particularly well.

The present owners of the Silver Cloud mine, Camp Floyd Dist., are piling up ore at Walker Bro's mill, preparatory to a run on the same. They expect to commence when they get 200 tons on hand. Meanwhile, the proprietors of the mill are rushing up their roaster.

**TINTIC.**—Cor. same: The Wyoming, half a mile east of Eureka Hill, is being worked steadily and developing most satisfactorily, the rock improving with every foot that is sunk. One shaft is down 150 ft.

The Mammoth is about a mile south of the Wyoming. The rock is almost pure copper. The portion owned by Armstrong, Atkins & Co., is about selling for a large sum.

From the Shower mine, they are shipping large quantities of ore to Salt Lake. This ledge differs from all the other mines in this dist., running almost east and west, and crossing at right angles the Hopkins, Joe Bowers and Silver Spar.

The furnaces, both here and at Homanville, are at present stopped.

**OPHIR.**—Cor. S. L. Review, Dec. 1st: The Kolar mine, about one mile northeast of the Brevoort mill, shows a vein 8 ft. in width, produces free milling ore with traces of gold. The average assay is \$98. The owners are extracting immense quantities of ore. The Crown Point, is on the north side of the canon, about one-fourth of a mile from the mill. The ore extracted is about the same as the Kolar, being free milling ore and assaying from \$75 to \$110. The owner has sunk a shaft about 10 ft., which shows a vein 16 ft. wide. Croppings on the surface can be traced 300 ft.

The Delatine, about one-fourth of a mile southwest from the Brevoort mill, shows a vein about 3 ft. wide, 25 ft. in a tunnel, and produces pure milling rock, black, and resembling decomposed slate, with streaks of chloride and white spar.

#### San Francisco Mining Stock Market.

THURSDAY EVE., Dec. 14, 1871.

Stocks have been active throughout the week. Sales at the Board for the week ending Wednesday 6th instant, amounted to \$1,447,600. Nearly 2,000 tons of ore were taken from the Crown Point mine last week, valued at \$60,000. For the month of November, 5,717 tons of ore were taken from the Belcher, yielding \$345,419 or \$60.71 per ton. The Nov. receipts of the Meadow Valley mine were \$156,423. The first shipment on December account amounts to

\$11,400. The Chollar Potosi dividend paid on the 11th inst. aggregated \$23,000. The amount of ore on the dumps of the mine is 1,300 tons and 2,746 tons are at the mill.

The November receipts of the Crown Point are about \$235,000, of the Savage, \$72,125, and of the Raymond & Ely, \$255,419. The North Star mine yielded in November, \$21,061, from 963 tons of ore.

Trustees of the War Eagle Mining Company were elected yesterday as follows: A. G. Hawes (President), C. W. Fox (Vice-President), Jas. S. Kennedy, John P. Couch and William R. Humphrey. C. F. Balcoln was continued as Secretary. The Company were incorporated on the 8th of September, 1871, with a capital of \$1,000,000, divided into 10,000 shares. The claim is at Silver City, Idaho Territory, near the Golden Chariot mine. About 400 tons of ore was milled last month, yielding \$15,000.

At the annual meeting of the Great Central Mining Company, of Humboldt county, Nev., held on the 11th inst., the following gentlemen were elected Trustees for the ensuing year: G. O'Hara Taffe (President), J. T. Boyd, John H. Turney, H. S. Tibbey, and J. Crownshield (Secretary).

## OUR HOME INDUSTRIES.

## The California Paving Company.

The works of this Company, which are located on Berry street, between Fourth and Fifth, were destroyed by fire some five weeks since, but are being rapidly rebuilt, and business has already been resumed. Their process of wood preserving is again in full operation, and a large amount of work is being done at present in preparing piles for the Central Pacific Railroad. The piles come from Puget Sound, and by this process are first subjected to a steaming in an immense boiler, under a pressure of several hundred pounds of steam; after which a preparation of hot pitch and other ingredients is let in, and forced into the pores of the wood. Twelve or thirteen hundred piles are now on hand, and are being subjected to the process. These are for the Central Pacific.

The company do also a large amount of work for the Government, and have an order on hand to preserve 2,000,000 feet of timber for the Wilmington breakwater, near San Pedro. They prepared the timber for the first section of the work, which is nearly completed. They prepare the wood for all the pine pavements laid down in the city, and do a large amount of work upon ship timbers, bridge timbers, etc.

The process used is Robins' process, sometimes styled the creosoting process, and consists in treating the timber with hydro-carbon oils. Wood, when properly treated by it, lasts for years without being subject to decay, and in fact it is almost universally used in preparing timber for the construction of works upon the Pacific Coast.

## Brush Manufacturing

is one of the constantly increasing local industries of San Francisco. One firm alone—Fieldman, Simpson & Co.—manufacture 15,000 brushes a month, of various kinds. They export largely to adjacent States, and to Japan, China, Australia and Salt Lake. This firm are sole proprietors of the rattan street and stable brooms, one of the most useful articles in the trade; this broom has a ready and constant sale, and the firm say that the demand is continually increasing. Of finer work, they manufacture some very handsome brushes, competing with the brush makers East, in quality and price of goods.

## Scientific Chicken Fountain.

The accompanying cut represents Orndoff's drinking fountain for fowls, which is intended principally for young chicks. With troughs as usually constructed, they get wet, which has the effect of injuring them more or less, retarding their growth, cramping their legs in cold weather and in some cases actually killing them. For young turkeys in particular this is a great convenience, since a bad wetting is almost certain death to them. In drinking from a trough the little things are frequently crowded into the water, but by the use of this contrivance the danger would seem to be obviated, for the holes are only large enough for one or two to drink at a time, and too small for them to tumble into. Two sizes are made, in case they should be required for large fowls, to keep them from fouling the water which is constantly at the top of the drinking holes without running over. The water is thus kept from running over and wasting by the application of a well-known principle of atmospheric pressure.

**FEARS UNFOUNDED.**—Recent advices from England express grave apprehensions on the part of capitalists who have invested in the Utah mines, that possession of their property will be jeopardized by the Mormon troubles. Such fears appear ridiculous in this country, and have no foundation except in an ignorance of facts and sensational reports.

## Sowing the Vine on the Vine.

Father Accolti of the Santa Clara College has transplanted from the *Unita Catholica* the following article: Mr. Dominic Perone was very anxious to reduce his own extensive vineyard to one single and particular kind of grape. To destroy all the old vines and plant them with new ones, he thought was a plan which, besides requiring an extraordinary outlay, would be against the tender feelings of an agriculturist, who naturally cannot but with great repugnance hear the idea of destroying those plants which for many years have proved beneficial. To engraft all these vines anew would be a matter of doubtful success, and besides would deprive the proprietor of an almost certain income for many years to come. In the midst of such perplexities an idea occurred to Mr. Perone, and this was sowing the vine on the vine. Such an expression on account of novelty, is at first sight almost incomprehensible, but it becomes intelligible as soon as the reader gets acquainted with the method adopted by Mr. Perone which is as follows: He at first picks up with great care and discrimination some grapes perfectly ripe, of that very kind which he wishes to introduce into his vineyard, and keeps them in a dry place. When in spring, by making a small cut in the vine, it bleeds and the sap oozes out, he makes a small hole in the lower part of the mainstock with a gimlet, and introduces into it a seed of the grapes preserved. This is what he calls "sowing." This seed—which has been kept alive for months by the moisture contained in the berry—being immersed in a liquid homogeneous and connatural, now germinates, and the sap, hardened by the contact of the air, envelops the small root of the new little plant, which identifies itself with the main stock and grows up with the other branches. Meanwhile the mother vine continues to bear fruit. After two years the new offshoot is pruned. The third year it bears grapes. Then the old vine is cut above the newly-sown plant, and thus the change or renovation is perfectly operated.

## Rail Road Mines Near Elko.

These mines are situated about 25 miles south of Elko, and mostly upon the southeast slope of Bunker Hill Peak, one of the highest points upon Railroad mountain, reaching the altitude of 9,050 feet.

This rich district was discovered and organized near two years ago by men possessing little or no means for the development and opening of the mines they had found. Hence there has been no work done developing the district except such as was absolutely necessary to give title to the locators of the claims in pursuance to the laws of the district, and the mines were not brought into notice until the latter part of last spring, when C. E. Gillette and Hogle of Carlin, Alexander Kinkead, E. V. Robbins and others of Elko, in connection with some New York capitalists, took hold in good earnest and have met with success beyond the most sanguine anticipations.

The formation of this district is somewhat peculiar and different from all others that I have seen. The bed-rock lies in alternate sections or fields of granite, porphyry, quartzite with crystallized feldspar intermixed; also, slate and limestone, the latter predominating. The general appearance and surroundings of the district are not unlike some portion of the foothills of the Sierras in California. The presence of timber with little or no sage brush in the vicinity of the mines, with plenty of pure cold water, and an abundance of grass and flowers in and around Bullion City, gives the place an air of homelike appearance and permanency.

After a careful inspection of the many ledges and the several grades of ore peculiar to this district, I am led to the belief that here will be opened some of the most extensive and valuable lodes in Eastern Nevada—equal, if not more extensive, than Eureka, as a district with the same combinations of carbonates, oxides, etc., of lead, and in some instances carrying gold with the higher grade galenas; also magnetic iron. Assays show ores yielding as high

as \$1,500 in silver, with a fair percentage of other metals.

The success which has heretofore attended the reduction of ores at Eureka by smelting process, is due to the splendid fluxing material found in the same vein matter with galena, or in distinct ledges in the same vicinity.

To notice the peculiar local appearances and combinations of each ledge, with its favorable or unfavorable surroundings, would occupy too large a space and at the same time perhaps be too dry and uninteresting to the reader. In view of this fact, I shall only call attention by name to a few of the richest and most important lodes now being worked, and from which ore is being extracted, namely: Shoo Fly and Last Chance, both fine ledges and owned by E. V. Robbins of Elko. Bullion and Bullion Extension, also Bullion Tunnel, intended to explore and prospect the above named lodes, are being worked and owned by C. E. Gillette of Carlin. Red Jacket, Lone and True are rich lodes of smelting ore owned by Dr. Alexander Kinkead of Elko. The Hussey tunnel, penetrating Bunker Hill, about eight hundred feet below the summit, is intended to prospect and develop the above mentioned property of Dr. Kinkead's; tunnel owned by Hussey & Co. of New York.

"Tripolia" and "Wehfoot," both splendid lodes, worked and owned by A. J. Ralston & Co. of San Francisco. "Black Warrior," a rich lode of milling ore, the only one in the district, owned by Franks, Cary & Co. of Carlin. "Lyon Lode,"

SCIENTIFIC CHICKEN FOUNTAIN.

another excellent deposit of smelting ore, owned by Morgan, Peyton & Co. of Bullion City. The "Ella Lode" is a large deposit of copper, heavily charged with silver, owned by Cary & Co. The "Mayflower" is also another fine deposit of smelting ore, owned by Tansy & Co. of Elko.

I have given your readers the facts in relation to the district from a personal inspection of the various lodes and their surroundings, and do not desire to see any undue excitement or wild speculation, which has come near destroying the reputation of several districts in this State. Let the truth be told and facts correctly reported, and we then need have no fears of the result. Mining is the chief occupation of our citizens, and upon it depends to a more or less degree the success of individuals in every other calling; therefore carefully foster this great interest, and should the aid of capital be required (as it is necessarily) for the development of our resources, let us secure it not by misrepresentation, which never avails anything except for injury to the parties using it, but by disseminating truth, which is amply sufficient at all times to secure the desired result for a community or an individual.—*Sac. Union.*

**BRANDY FROM MANZANITA BERRIES.**—The Nevada Transcript has the following: I. J. Rolfe and Josiah Rogers have started the manufacture of brandy from manzanita berries. We visited Mr. Rogers' wine house yesterday and witnessed the process of manufacture. The berries are first fermented in a vat with water and then the liquor is distilled. It has more body than grape brandy, and is much smoother to the taste than grape brandy of the same strength. Messrs. Rolfe and Rogers are highly pleased with their experiments, and they propose to make, this year, about 200 gallons of manzanita brandy. The berries are very abundant and can be gathered at one cent per pound. Another advantage is that they can be kept in sacks like grain until required for use, while grapes must be pressed when taken from the vine. The entire cost of cultivation is also saved, as manzanita grows in such quantities that

a hundred distilleries could be supplied without making much of a drain upon the crop. If the liquor improves with age, as does grape brandy, it will be a great favorite, as in its new state it is much more agreeable to the taste.

The parties mentioned above have recently secured through the agency connected with this office, a patent for the manufacture of brandy from manzanita berries. It is said that from 100 pounds of manzanita berries three gallons of brandy can be manufactured, while it takes from 75 to 80 pounds of grapes to make one gallon. Furthermore, the former makes the best article.

## The First California Vineyard.

About the year 1771, the vine was first planted in our State, and Mission San Gabriel claims the honor of having the first vineyard. The early history of this vineyard, as well as the origin of its vines, is lost in the past, but has given rise to many speculations. It is believed by some that the vines were brought, by roots or cuttings, from Spain, either directly or by way of Mexico; others hold that these vines were taken from some one of the many wild varieties that are scattered over the whole State; and there is still another theory, which is upheld by General M. J. Vallejo, than whom there is no better authority on the subject in the State.

According to his statement, the Fathers first tried to make wine from the wild grapes, but, being unsuccessful, planted the seeds from raisins that came from Spain. The result of these experiments gave them several varieties, among which are our present blue Mission and a white grape of a musky flavor. These two, after due trial, they retained and propagated, rejecting all the others.

The first two theories are certainly very defective; for, even with the quick and certain journey that can be made in our days of steam locomotion, an enormous percentage of roots and cuttings die on the trip—in fact, but a very small percentage reach us in a living condition, and it requires all the advanced horticultural skill of our age to revive and sustain them. As for once being of the wild species, they do not bear the faintest resemblance, either in fruit, leaf, or wood, to any wild variety. The bunches and grapes are large, the leaf full and decidedly marked, and the joints comparatively close, while their branches are sturdy—characteristics that are seldom found singly, and never collectively, in any one wild species of grapevine.

More probable than either of these theories, is that the seeds were purposely sent out from Spain, through Government authority, as certainly where the orange, the lime, the olive, the fig, etc., and this is the only rational manner of explaining the presence of the same two varieties—blue and white so called Mission grape—in New Mexico, where they are universally cultivated. The missions in both provinces, being under the direction of the same power in Spain, would naturally receive the same selections of seeds.

It is claimed by experts that the blue Mission grape is the same as the Beni-Carlo, but that does not alter the strength of the argument, for it may be its seedling, just as the Pineau of Burgundy has some eighty different seedlings, each and every one closely resembling the parent grape and vine.

It matters little, however, practically, where the first vines came from. They were known to grow at the Mission San Gabriel, and from there the planting of the blue Mission was extended from mission to mission, until not a single one was without it. The blue grape seems to have been the favorite with the Fathers, and undoubtedly because its wine resembled the red wines of Old Castile.—*Overland Monthly.*

THE OVERLAND MONTHLY completes three and a half years of its publication with the December number. Its management, by John H. Carmany & Co., for the last two and a half years, has been a success, financially, as well as in literary reputation. It was fortunate for the magazine that it fell into the hands of those who were able and discriminate enough to command the best talent on this coast to fill its pages ably and acceptably. It continues to improve from volume to volume. Its varied literature is greatly prized at home, and it is highly credited abroad, for the vigor of its originality. We could mention several valuable articles in the December number, but all we have read are creditable. A new volume commences in January. Subscription, \$4 per year.

## POPULAR LECTURES.

## THE ATMOSPHERE.

[Prof. Ez. S. Carr before the Mechanic Arts College, Mechanics' Institute Hall, S. F. Reported expressly for the Press.]

LECTURE I. Dec. 9.—The Hall of the Mechanics' Institute was well filled last Saturday evening, by those who had enrolled themselves as students at large, of the Mechanic Arts College.

At 7½ o'clock President Hallidie stated that the course would consist of twenty lectures, governed by the same general rules that were in force during the last course. The hall would be opened at 7 o'clock, and the lectures commence promptly at half-past seven, at which time it was necessary that all students should be in their places. Absence from two consecutive lectures, or three in all, would work a forfeiture of the seat for the season, and that a limited number of visitors' tickets were in the hands of the Regents and the Secretary of the Institute. He said also that the regular seats of the class would be assigned at the next lecture. He then introduced Professor Carr of the University, who proceeded to deliver

## The Introductory Lecture.

He began by saying that knowledge was a true acquaintance with things. Science was organized knowledge, and education organized common sense; and these facts would be the key-notes of his lectures. He alluded to the fact that a great many people suffered from mental dyspepsia, because they stuffed themselves with other people's ideas. It was a prevalent error to look too far off for our knowledge—to investigate the geography of the moon while neglecting that of our country. And the Professor stated in his lectures he would confine his class to things at home, and would begin with the most common and familiar of all things, the Atmosphere. He then, by the aid of large charts, explained the component parts of the air we breathe, and proceeded to speak more especially in the lecture of the evening of the qualities of the two principal ingredients, oxygen and nitrogen.

He said that it had been announced that the lectures would be illustrated with the University apparatus; that announcement he said was true. Placing his hands on an ordinary wash tub, he remarked, "this is one of the most useful articles in the collection," and stated that the experiment he intended to present that evening he would show, could be performed with the simplest materials. The table of component parts of the atmosphere was first referred to set out on a printed chart.

Oxygen.....	20.61.....	1,233,010,000,000,000 tons.
Nitrogen.....	77.35.....	3,994,593,000,000,000 tons.
Carbonic Acid.....	.04.....	5,287,000,000,000 tons.
Aqueous Vapor.....	1.40.....	54,400,000,000,000 tons.
100.00.....	5,287,350,000,000,000 tons.	

He then proceeded to the first experiment which consisted in obtaining oxygen gas. In performing the same he made use of the following language.

## Oxygen

may be obtained in a number of ways. The simplest manner of obtaining this gas is to separate it from solid bodies. I have here common chlorate of potash which contains over one-third oxygen. By mixing this with black oxide of manganese in this small tube, and gradually heating the mixture, oxygen is set free as a gas. In order to ascertain if oxygen has been produced, I take a common piece of splintered wood, set it on fire, then extinguish the flame, and insert the glowing end in the tube. If oxygen exists the spark will immediately brighten.

He here performed the experiment for the benefit of those present, and satisfactorily. In order to give you a better idea of how oxygen may be obtained in larger quantities, I would direct your attention to the retort before me in which is pre-

pared the mixture of chlorate of potash and black oxide of manganese. Beneath the retort I have adjusted a small lamp to be used in heating the mixture. A tube is attached to the retort which connects it with the water contained in the tub. Within the tub, about three inches from the top of it, I have adjusted shelving, on which to place these jars which are for the purpose of containing the oxygen gas as it is evolved from the mixture in the retort. The shelving is immersed in water about one inch. I place the mouth of the jar over the tubing connected with the retort, the water surrounding the outlet of the jar prevents the escape of the oxygen when it comes off from the mixture. In a short time the jar is filled and more may be obtained if desired. I now use the same means of ascertaining the presence of oxygen that I did before.

By introducing this steel watch spring, one end of which I previously heat by igniting some sulphur placed there in the form of a match. Combustion takes place and the steel wire is seen to burn with even greater brilliancy than more combustible matter, throwing off sparks in every direction.

All the Professor's remarks were illustrated with satisfactory experiments. He then proceeded to say: No element in nature has so strong an affinity for other bodies as oxygen. Oxygen is thus a great source of power both in heat and light; the decay of animal and vegetable substances is caused by it, for if we would stop decay, we must exclude atmospheric air. Breathing, as is known to all, is the essence of vitality. Our lungs operate as the bellows; when oxygen traverses every part of our bodies which is affected by the circulation of the blood, the temperature of the body necessary to existence is kept up by oxygen meeting and uniting with certain bodies and burning them. The motion of the muscles, activity of the brain, each vital movement, is directed by the union of oxygen with other elements.

Direct observation has proven that oxygen makes up more than one-half of the entire globe, eight-ninths of the ocean, and one-fifth of the atmosphere; of all animals, three-fourths; all mineral matter, one half; and all vegetable matter, four-fifths. It has a powerful effect in destroying organic bodies. Were oxygen alone in the air, it would act much more energetically than under the present combination. The process of combustion and decay would be very rapid, and that of life would go on with greater energy.

## Consumption of Oxygen.

An adult consumes daily between one and two pounds of oxygen. Say that the population of the world be rated at 1,000,000,000. To each person allow one pound per day. Calculate the amount consumed in other ways in an approximate manner. Upon this basis we will find that the daily consumption will amount to the following proportions: man, 1,000,000,000; animals, 2,000,000,000; decay, 4,000,000,000 pounds, making in all about 8,000,000,000 pounds, or 3,571,428 tons of oxygen consumed daily. Suppose that the amount of oxygen at present in the atmosphere should remain without increase upon the hypothesis of calculation just stated by me, it would take 945,098 years for all the oxygen of the atmosphere to be consumed.

## Supply of Oxygen.

The prime source of disease is bad ventilation. When sickness is at our doors, Providence is blamed as the cause. When a mother sees her child laid low in illness she finds fault with Providence for her affliction. This is all a mistake. Providence has nothing to do with sickness, it is the neglect of Nature's laws that entails disease and consequent death. Ventilate your rooms. Ventilate your public halls, your places of amusement. Eat proper food; take judicious exercise. All these are among the first rules of the laws of Nature. If these rules are adopted disease will not be so frequently complained of. If a man would understand how long he could exist in his room with safety, being ill ventilated he may take the dimensions of his room, calculate the amount of air it would contain and what length of time it would take to consume the oxygen in it.

We cannot reduce the amount of oxygen to more than 4 or 5 per cent. without endangering the life of the higher order of animals. If there were no means to provide for the restoration of oxygen to the air the existence of man on the earth would

be rendered impossible in a short time. Another common element of the atmosphere is

## Nitrogen.

This is a colorless, tasteless, and odorless gaseous body, the same as was said of oxygen. In order to obtain nitrogen for experimental purposes, we take a piece of phosphorus, burn it under an inverted jar placed over a water bath, in order to prevent fresh air from entering. The phosphorus in being so consumed, will take up nearly all the oxygen present and we shall have remaining principally nitrogen. You notice a white vapor is apparent after the phosphorus is burnt. This is phosphorus acid gas, the combination of oxygen and phosphorus. By shaking the water here present in the jar, it will be absorbed, leaving nitrogen alone.

Its effect is the opposite of that of oxygen. It is a non-supporter of combustion as will be made evident by taking a lighted taper and inserting the same into the nitrogen jar. We find that the flame is immediately extinguished. Nitrogen presents none of the activity of oxygen, on the contrary it is an indifferent and inert body. It acts as the balancing power to oxygen. It is a wise provision of the Almighty that a happy medium exists in the combination of the gases as presented to you by me in the beginning of my lecture.

## USEFUL INFORMATION.

## The Insect Nebula.

One has no idea, says Mr. Beecher, of the populeousness of spaces that seem empty to ordinary inspection. But at certain hours of the day, when the sun lies in the right direction, if one can get the range and angle of a section of air against a good background, so that whatever flies in it will reflect the light to his eye, he will see such swarms of things, large and small, as will enlarge his ideas of the sum of being. And what wind and bottom! A swarm of midges will play the game of insect nebula to perfection, whirling around some imaginary sun, as if swept by some force external to themselves, and not by their own tiny wings. There will be anywhere from a thousand to ten thousand in a group. They evidently have a common sympathy in motion. Although the finest ear cannot detect the sound, yet they either see, or hear, and whirl to some recognized signal—rising, falling, whirling to the right, opening out into line as if sent to skirmish; and whirling back again in an instant, and, rallying round and round their centre, they keep up this intense motion for hours together. The expenditure of vital force in these active little atoms must be enormous. But these are single tribes. The air is full of others of different nature and habits, whose varieties seem to increase as you look. All love heat. August is their crown month. Even the early days of September make a difference. The thermometer is up in the eighties, but the flies have grown soher. Only at midday are they themselves again. At night and in the morning they are stiff, and no doubt, if we understood their language, we should hear them complaining of the infirmities of old age, and lamenting the shortness of life.

## A Word About the Moon.

Every one is familiar with the singular phenomenon known as the "new moon carrying the old moon in her arms," when, in addition to the slender crescent, the whole disc is more or less distinctly visible a few days after the new moon; the same appearance, or "the old moon nursing the new," presents itself in like manner in the waning moon, when she rises a few hours before the sun; but we fear there are few who shake off dull sleep to see it. This is what is called the *lunæ cendrée*, or ashlight of the moon. Its appearance used to be taken as an indication that the moon was phosphorescent, or possessed some light of her own, independent of that she receives from the sun. Now, however, it is satisfactorily proved to arise from the sunlight reflected from the earth upon the dark moon; for it must be remembered that the earth is to the moon what the moon is to the earth, a reflector of the sun's light; and when it is new moon to the earth it is full earth to the moon, and *vice versa*, and thus the opaque moon becomes illuminated by earthlight—to use a term analogous to moonlight; but on account of the great size of the earth compared to the moon, this light is 14 times as bright as our moonlight, and thus occasional brilliancy of this "reflection of a reflection" is accounted for.

## GOOD HEALTH.

## Heart Sounds.

The action of the heart is remarkable for its rhythmical character, each of its four cavities exhibiting a succession of contractions and dilatations in the most perfect rhythm. It will be remembered that the heart contains two auricles and ventricles, each side having no communication with the other; both ventricles contract together while both auricles are dilating; the contraction of the ventricles corresponds with the projection of the blood into the arteries causing the pulse; the dilatation of the ventricles corresponds with the collapse of the arteries. The contraction of the ventricles takes place during the dilatation of the auricles, with a brief interval of repose; the duration of the contraction is twice that of the dilatation of the cavities.

These contractions and dilatations are accompanied by sounds, caused, principally, by the flapping of the valves at the openings of the ventricles, the aorta, and pulmonary artery. The blood, in passing from the auricles to ventricles, produces no sound; when the ventricles simultaneously contract, the valves between them and the auricles flap back to prevent a backward flow; this flapping, with the muscular contraction of the fibres, and the rush of the blood along the irregular surface of the cavities and through the orifices of the great vessels, causes the first sound; the second is produced by the shutting of the valves at the entrance of the aorta and pulmonary artery, during the dilatation of the ventricles. The capacity of each of the cavities is about two ounces.

There is a noteworthy difference between the perfection of the closure of the valves between the auricles and ventricles on the two sides of the heart; on the left side they close perfectly; on the right they do not, when the ventricle is distended. Many causes tend to produce an accumulation of the blood in the venous system, and consequently in the right side of the heart (as any obstruction to the circulation in the lung—cold, compression of the veins, etc.) which is a dangerous condition, from the liability to sudden death; in case of such distention, the blood is permitted to flow back through these valves, not only into the right auricle, but into the large veins; this condition is one of the few in which venesection will relieve impending death from suffocation and pulmonary congestion.—*Good Health.*

SINGULAR CASE OF SUNSTROKE.—The *Holly (N. Y.) Standard*, some time since related a singular case of sun-stroke which had then occurred in that town. While Daniel S. Waite was riding his moving machine on his place between that village and the Ridge, a load of furniture passed along the road, on which was a man holding a large mirror. The sun's rays glancing on the mirror were reflected so that they struck Mr. Waite, who fell senseless from his machine on the outside. He afterwards compared the effect to that of a blow powerful enough to knock him from his seat. The lines were passed around his neck, and the team stopped when he fell. After a time he came to himself and climbed partially upon the machine, and the team started and carried him to the road, where he again fell off and relapsed into a state of insensibility. He was discovered in that condition shortly afterwards and conveyed to his home. His life was for some time despaired of, but he has since recovered.

CURE OF STAMMERING.—The effectual cure mainly depends upon the determination of the sufferer to carry out the following rule: Keep the teeth close together, and before attempting to speak, inspire deeply; then give time for quiet utterance, and after a very slight practice the hesitation will be relieved. No spasmodic action of the lower jaw must be permitted to separate the teeth when speaking. This plan regularly carried out for six months, cured me when twenty years old. I was painfully had, both to myself and others. Without a determination to follow out the plan, it is of no use attempting it.—*Etc.*

SORE MOUTH AND TONGUE.—Three drachms of borax, two of sugar of lead, half an ounce of alum, and one pint of strong sage tea. Use as a wash.

WHEN AFFECTED BY FOUL AIR IN DESCENDING WELLS.—Throw down unsalted lime, then several pails of water before venturing to go down.

## Mining Accidents.

O. B. Clark, a miner near Diamond City, Montana, was caught by a caving mass of earth a few days ago and killed.

William Hart was seriously injured in the Oneida mine, Amador county, last week.

A Chinaman was caved on in a mining claim on Gold Hill, Idaho, a few days ago, and killed. He was a member of the See Yup company.

Patrick Quinn had his right hip broken in the Crown Point mine, at Virginia, recently, by coming in contact with the timbers while riding on a car.

A miner named Cox, had the little finger torn from his right hand in the same mine, by getting it caught between the car and the timbers.

## Recent Mining Discoveries.

Two silver bearing ledges have recently been discovered near San Bernardino.

A whole hill of a substance, resembling magnesia, has been found on Battle Creek, Oregon.

ASSAYERS' AND PROSPECTORS' OUTFITS.—The house of John Taylor & Co., in this city, has been established since 1852, and has been furnishing assayers' and prospectors' outfits since the first discovery of the mines on this coast. They have now the most complete stock of assayers' materials on the Pacific slope. The goods are all imported direct from England, France, and Germany, and are of the finest quality. Their advertisement will be found in another column.

ON FILE.—Communications from Dun Glen; San Diego mines; Smelting and Milling in Utah.

## The State Geological Survey.

At the last meeting of the Academy of Sciences, Prof. Whitney made a semi-official statement of the progress of the State Geological Survey. He stated that after providing for the continuance of the survey, a party was fitted out to explore and map the region south of Mono Lake and the Inyo and White Mountain ranges. After completing this difficult and expensive undertaking they went to Aurora, and with Prof. Whitney surveyed the country west of that place and about the head of the East and West Walker, including a portion of the Sierras embraced between the branches of the Walker, Stanislaus and the Tuolumne. The completion of these surveys gave them the necessary data for finishing the southeast quarter of the central map.

Of the Central California map which embraces about one-third of the area of the State, the southwest quarter is done, the southeast quarter will be finished in February and the northeast quarter is ready for the engraver as soon as the southeast quarter is done. The northwest quarter is two-thirds drawn. If the requisite funds are forthcoming to continue the survey the whole map can be finished so as to be laid before the Legislature of 1873-4. This will be the completion of the most extensive piece of topographical work yet undertaken in the United States, the Coast Survey and U. S. 40th Parallel Survey excepted.

A general map of reference, both geological and topographical, of the State of California, has been completed, on the scale of 18 miles to an inch and in which is embraced all the information possible to be shown on that scale.

A Map of the Mining Region is partly completed, extending from near Knights Ferry to Quincy in Plumas Co., occupying an area of nearly 10,000 square miles. Its principal object is to show the detailed geology of the mining region and especially the position and situation of the great deposits where hydraulic operations are going on.

## Placer Mines.

A detailed survey of the gravel districts has been made for the purpose of throwing light on the relation, position and origin of these remarkable and highly important deposits. Messrs. Bowman, Potter, and Goodyear have been engaged in this work. The latter gentleman has also been mapping and exploring the detailed geology of the eastern slope of the Sierra Nevada, during the whole season of 1871, and is still employed in his researches, the result of a portion of which as far as they concerned the mines in the vicinity of Placerville, we published a short time since. His field has been to the south of the North Fork of the American River, and that of Messrs. Bowman and Potter to the north.

In the prosecution of this work a large amount of valuable information, both of a geological and geographical character has been collected. It is confidently expected that the condensing of all the material collected, with the accompanying maps and sections, will exhibit the phenomena of gravel deposits, in regard to which there has been so much discussion, and such a number of opinions, in a new light, and that many difficulties which have hitherto perplexed the miners will be solved. Professor Whitney desired the work to be continuously prosecuted until a full and detailed map of, and report on, the whole region has been prepared, which he thought could be accomplished during the next session, if the pecuniary means are forthcoming. The size of the map and the amount of detail to be placed upon it will depend chiefly upon the liberality of the present Legislature.

## Barometrical Observations.

During the explorations in the gravel re-

gions, a great many barometrical observations have been taken for the purpose of determining the grade of ancient river channels. Barometrical stations have been established at several points on the Central Pacific Railroad, and one at the office of the Survey in San Francisco, where observations have been taken for over a year at the Smithsonian hours, 7 A. M. and 9 P. M., and great pains have been taken to have the observations well and punctually made. Already ten months observations have been completed, and valuable and interesting results obtained. It would be desirable to have a station established at a point higher than Summit, but this at present seems impossible. Summit Station is the highest permanently inhabited point in California, and probably the only station raised as much as 7,000 feet above the sea-level, of which we shall have a spirit level determination for some time to come.

The question as to how and where the geological portion of the Survey shall be published is one that it is impossible to answer, until some definite steps as to appropriation, are taken by the Legislature.

Prof. Whitney alluded to the publication of the Yosemite Guide Book, and the first volume of the Birds of California. Work had also been begun on the volume on Conchology.

The intention is to issue from 11 to 16 works according to the liberality of the Legislature. If eleven, the division would be as follows: General Geology, 2; Economic Geology, 2; Paleontology, 2; Botany, 1; Zoology, 4; Maps, etc., 1. If sixteen, in addition to the foregoing, there will be Physical Geology, 1; Economic Geology, 1; Paleontology, 1; Botany, 1; Zoology, 1; of these the following have already been issued, Geology (Report of Progress), 1; Paleontology (Invertebrata), 2; Zoology, 1.

## Science vs. Ghosts.

The public of this city has been very much exercised during the past week with regard to certain somewhat remarkable appearances which have been noticed upon several panes of window glass, first in the residence of the widow Jorgensen on Mason street, and afterwards in that of Mr. Hucks, "just round the corner." All sorts of theories have been suggested to account for the phenomena, and the "spiritualists" and "ghost sharps" have made the most of the opportunity to create capital for their favorite theories.

The appearance of "images" upon glass, such as have so astonished the wonder seekers of this city during the past week, is no new thing under the sun. On applying to Mr. C. Newmann, of the San Francisco Glass Works, for information upon this matter, he has placed in our hands two somewhat rare volumes, treating upon the philosophy and curiosities of glass making, in which, such appearances as those noted above, and many other singular changes in the character and appearance of glass, are noticed, as the result of well-known natural causes. Some writers having attributed such changes to the action of fire, one of the authors above referred to, says:

The presence of garments and jewelry [found in ancient tombs] which bear no signs of any alteration forbids all idea of fire; we must therefore endeavor to find elsewhere the cause of this iridescence. Here again M. Peligot comes to our aid. "The majority of glass objects," says he, "whose manufacture dates back to a remote period, have undergone, by the influence of time and damp, a very marked alteration. All the old glass which is found in the tombs of the ancient Romans and Gauls presents an iridescent and black aspect, giving sometimes very brilliant reflections, like those of the wings of certain species of butterflies. It is to be found even on panes of glass of more modern manufacture placed in the windows of stables, etc., viz., places often exposed both to constant damp and high temperature. The iridescent scales, which can be easily removed by gentle rubbing, are a mixture of silica and earthy silicates, the alkaline silicates having disappeared."

## HINTS TO MINERS—NO. 3.

### Placer Deposits.—(Concluded.)

To some such process of solution and deposition, as was spoken of in our last issue, we may ascribe the presence of gold in rocks and veins; its alteration and reduction to metallic form ("free gold") in the upper or exposed parts of such rocks or veins; and, finally, the still greater purity and size of its particles, so frequently noticed in placers. As Lieber very forcibly remarked, if we are forced to believe in the reduction and molecular aggregation of gold above the water-line in veins, we must expect the same process to be still more likely in placers, which are more exposed to atmospheric agencies and percolating waters. It is not necessary to assume, however, that this process takes place in all cases. On the contrary, certain chemical reactions being involved, there must be certain coincident conditions. This theory affords the only rational explanation of the influence of eruptive rocks upon auriferous deposits.

It must be confessed that the mechanical processes of deposition of alluvial deposits are by far the most influential and universal in such formations. As already remarked, superficial deposits sometimes occupy the precise locality of the rocks from which they are produced; as, for instance, numerous gold diggings in the Southern and Pacific States on the very outcrops of auriferous veins. These not having undergone to any extent the processes of mechanical concentration and accumulation, are not so rich as placers of accumulations. Cotta lays down the following rules, deduced, *a priori*, from the method of formation, and confirmed in practice:

1. Placers *in loco* will be likely to carry metals in quantity and distribution like the original deposits on which they lie.
2. Alluvial placers of accumulation will be richest in those places where the current of the stream was interrupted by a diminution in its fall, by a sudden change of direction, or by the entrance of a tributary. (I would add, also, by reefs, bars and eddies.) The absolute richness, however, depends upon local circumstances, and the size and weight of the floated masses must be taken into consideration.
3. Especially rich are frequently, of course, the small depressions, holes, creases and fissures of the bed-rock over which the current passed.
4. The lowest layers of each period of deposition are usually the richest.
5. Sometimes, however, several periods of deposition have succeeded each other; and thus several rich strata may appear in the same ground.

Not only the courses of present streams, but also, and especially the ancient channels now forsaken, are the localities of placers.

Of these rules, the fourth and fifth, especially, deserve attention. A period of depression may be understood as the time during which all the mass of alluvial material is sensitive to the action of water. By the gradual cementing process already alluded to, or by an interruption of the aqueous action, the alluvial layers may become so hardened as to form a new bed-rock; or, simply, by great accumulated depth, they may seem to be affected to the bottom by the action of the stream. The result would be, if the deposition of material continued, a second series overlying the first. The miners of the Pacific Coast have learned by experience that there are frequently two or three bed-rocks, and corresponding strata of maximum richness, alternating with others more or less barren. Many old diggings, supposed to have been exhausted, will undoubtedly be worked again, with deeper bed-rock tunnels, and will yield more gold than ever.

Gold placers from the nature of their formation, are generally in their richest parts, much richer, by virtue of the concentration which they have undergone, than the strata or vein from which they are formed. The possible aggregation of particles, to nuggets larger than the

masses formed *in situ* has already been noticed.

But, under some circumstances the veins may be richer than the resulting placers, as for instance, when the original rock is so hard as to resist in a higher degree than the country rock, the disintegrating influences, so that for every small portion of auriferous material detached an immense quantity of the harder debris is carried away in the same streams; or where the peculiar arrangement of water courses is such as to scatter instead of concentrating the auriferous material. But these instances are rare. On the other hand the amount of material to be extracted and treated for obtaining a given quantity of gold is generally much greater in placer than in vein mining.

The removal of poor or barren strata, in the search after the richer accumulations, etc., are heavy items and it should be remembered that the capital thus invested must pay for itself in a short time or become a total loss.

#### Railroad Items.

CALIFORNIA has, at this time, 902½ miles of railroad in active operation, as follows: Main Central Pacific Road (to State line), 293; California and Oregon branch of same (Roseville Junction to Red Bluff), 115 miles; San Joaquin Valley branch of same (Lathrop to Bear Creek), 58 miles; Southern Pacific (to Hollister) 100 miles; Watsonville branch of same, 20 miles; California Pacific (Vallsjo to Marysville), 95; Napa Valley, branch of same, to Calistoga, 33; North Pacific (Donahue to Healdsburg), 42; Sacramento Valley road, 48; California Northern (Marysville to Oroville), 26; San Pedro and Los Angeles, 21; Stockton and Copperopolis Road to Milton, 48; San Rafael and San Quentin, 3½.

It is believed that the new Central railroad route from Denver to Salt Lake, along the South Platte to Middle Park, and thence westward, will be shorter than the present route, by 200 miles.

It is announced that the San Joaquin Valley railroad will be completed to a point 20 miles south of Visalia, by next July.

RAILROAD matters are lively in Sonoma county. The lengths of the different lines projected are as follows: From Donahue to Russian River, 35½ miles; from there to Cloverdale, 17½ miles; from the Junction to Bloomfield, 13 miles.

The branch line of the Southern Pacific railroad, extending into the Pajaro Valley, has been opened for passengers and freight.

The grading on the railroad between Banta's and Oakland is progressing rapidly. It is expected that the work upon the portion of the line from Banta's to Martinez will be completed by the first of February.

A narrow-gauge railroad, from San Francisco to the Colorado River, via Santa Cruz and Watsonville, is talked of.

The surveys on the San Diego and San Bernardino railroad have been commenced, and active operations will begin in immediately.

Work upon the western end of the Northern Pacific railroad is progressing rapidly in Washington Territory. The first 20 miles from Kalama is about completed, and contracts are advertised for the next 30 miles.

The Walla Walla and Columbia River railroad company have gone to work in good earnest, to complete the project of a railroad from Walla Walla to Wallula. A new route is being surveyed by which many bridges and difficult places are avoided.

The proposed railroad from Portland, via Boise City, Idaho, to a point on the Union Pacific, near Salt Lake, is engaging considerable attention in Oregon, and an effort will be made to carry out the enterprise immediately.

The Northern Pacific have found a fine route for their road through the Yellowstone country.

The surveying party running a line to connect the Colorado Central with the Union Pacific, have reached Greeley, locating the line a little north of that town.

Work on the three-foot extension of the Colorado Central, up the Clear Creek Cañon is progressing. A considerable section is graded 12 miles up the cañon.

ARRANGEMENTS have been completed for the extension of the Denver and Rio Grande railroad to the Arkansas river.

At the latest dates, the Texas Pacific Company was applying to the Texas Legislature for permission to use the narrow-gauge.

The Missouri, Kansas and Texas railroad is contracted to be built through the Indian Territory to Red River.

#### Best's Grain Separator.

Our illustration represents an improved grain separator, the peculiarities of which principally consist in the employment of a series of peculiarly-shaped screens, for the purpose of separating and cleaning the different qualities of grain; and also the use of feeding and returning elevators, by which the grain can be fed to the hopper with very little labor, and by which it can be returned to the hopper for a second cleaning, if desired.

The discharge spout for the second quality of grain is so arranged that it will either discharge the grain immediately, or allow it to pass to the returning elevator, if it is not sufficiently cleaned. The first quality of grain is allowed to fall upon a

BEST'S IMPROVED GRAIN SEPARATOR.

screen, which has a peculiar tossing motion, and which throws it into the discharge spout, or, by reversing the movement, the grain can be kept in the screen as long as desired.

A set of angular plates are introduced between the screens, and by their action, and the shape of the screens, the blast is directed forward instead of backward. The discharge spouts are constructed so as to operate separately or together. The machine can either be used as a stationary one, or can be moved about at will by being placed on wheels.

At one end of the frame is placed a hopper, which is low, so that the grain can easily be discharged into it. An elevator takes the grain from the hopper and carries it to the upper one. From the latter the grain passes to the cleaning apparatus, its discharge being regulated by an adjustable gate. The cleaning screens are all secured in one frame, in two sets, which are separated by a riddle consisting of a series of vanes placed at an angle, so that by their action they direct the wind from the fans forward and upward to the upper series of screens.

The frame which contains the screens and the riddles, has a side-shaking motion given to it by means of the bell crank connected with the crank or eccentric wheel, so that all the screens have the same motion. The screens are given a peculiar downward curve near their rear end so as to facilitate the discharge of grain after it has passed beyond the reach of the blast.

The lowermost screen, which finally receives and retains the good wheat, is separated from the upper set, and has a peculiar tossing motion given it, so as to thoroughly separate the small grains and chaff. From this screen the wheat is finally delivered into the discharge spout. The second

quality of grain will be carried over the rear edge of the screens and will fall into a spout from which it can be discharged at one side; or if it be desired to give it a further cleaning, a gate near the center of the spout is closed and the grain can be directed into an elevator, which discharges it into the first hopper, so that it will again pass through the screens.

This improved machine is the invention of a thoroughly practical man and deserves general attention. The patent was taken out through the SCIENTIFIC PRESS Agency, by Daniel Best, of Yuba City, Yuba county, Cal., who may be addressed for further information at that place.

#### Watson's School Desks and Seats.

We call the attention of school directors and business men generally to an improvement in school desks and seats which possesses the advantage of being simple

and convenient, and that of giving more comfort to those who are compelled to be in a sedentary position for any length of time.

Persons who went to school thirty or forty years ago, no doubt recollect distinctly the uncomfortable forms or benches

WATSON'S SCHOOL DESKS AND SEATS.

on which they were compelled to sit for hours, and which seemed to have been made more as a means of punishment than of comfort and ease. Now-a-days, students are treated in quite a different manner, and all the school furniture is manufactured with a view of being as convenient as possible. Our illustration represents a new improvement in this line, which is a desk and seat combined in a simple, portable article of furniture, in which both the seat and desk are adjustable, with relation to each other, so as to accommodate scholars of different sizes.

By referring to the cut, it will be seen that A represents a board about 2½ feet long, upon which is secured both the desk and seat, so that they can be moved as one article of furniture. This board is placed on castors, for conveniences in changing its position. At one end of the board, A, the posts, C, are secured by the braces, d. On the outside of these posts is a channel and a rack. The desk is constructed as usual, but is provided with two legs, G, G, only, which extend downward from the back of the desk. The legs are placed at the proper distance apart to slide down the posts, C, being provided with a tongue that bites in the groove, and are supported by a cross brace at the lower end. A spring pawl, i, is arranged to work through a mortise in the legs and engage with the rack on the standards, while the opposite end is made to be depressed by the thumb, and disengage the pawl when desired. By this arrangement, the desk may be raised or lowered to any desired height, and kept in its position in a firm manner by the pawl. The desk is provided with stationary inkstand and pen-rack, as shown.

A slot, M, is made through the platform, A, in front of the desk where it is desired that the chair is to be placed. This slot is made at right angles to the seat, so that the seat, which is secured in the slot, can be moved to or from the desk as desired. A square block, O, through which is a round hole, fits loosely in the hole through the block, N, having a rack on two of its sides. The sides of the block, N, next to these racks, are slotted, and pawls, g, are arranged to operate in the slots, so that it can be raised or lowered and kept in any desired position. The chair has a single leg or standard, extending down through the block, O, and is confined by a pin beneath, so that it will revolve. The chair may be fixed to the platform through the slot by any suitable contrivance.

The entire arrangement forms a neat and convenient article of furniture, that can be moved about at will, and making a complete desk and seat, suitable not only for schools but for general business purposes. Our engraver has taken some liberties with the model which was placed before him, making the cut a little more ornamental; but it can be made in any style desired, either plain or ornamental. This improvement was patented through the SCIENTIFIC PRESS Agency, by Wiley Watson, of Visalia, Tulare county, Cal., from whom further information concerning it may be had.

#### PATENTS & INVENTIONS.

##### Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

- FOR THE WEEK ENDING NOVEMBER 28.  
 ATTACHMENT FOR PLANERS.—Alonzo S. Hewlett, Sebastopol, Cal.  
 CAR-COUPLING.—Henry H. Morgan and Albert Gerry, San Francisco, Cal.  
 NOZZLE.—Thomas Watson, Nevada, Cal.  
 APPARATUS FOR AMALGAMATING GOLD IN TAILINGS.—Thomas A. Pratt, Marysville, Cal.  
 TRAMWAY SADDLE.—Joshua Clayton Robinson, Hamilton, Nev.  
 MOTIVE POWER AND BALANCE CAR.—Joseph Bayman, San Francisco, Cal.  
 FOR THE WEEK ENDING DECEMBER 5.  
 CHILDS' CARRIAGE.—Edwin Falkingham, San Francisco, Cal.  
 WASHING MACHINE.—Charles Larrabee, Haywood, Cal., assignor of three-fourths of his right to John Yule, same place.  
 ANIMAL TRAP.—Henry Polley, San Francisco, Cal., assignor to himself and Isaac Jessup, same place.  
 BUTTER-MOLD.—Anthony J. Derrick, Sheridan, Nevada.  
 MORTISING MACHINE.—Enoch J. Rowe, Eureka, Cal.  
 LAMP-BRACKET OR SUPPORT.—Henry Campbell, San Francisco, Cal.  
 LUBRICATOR.—William T. Garratt, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible by telegraph or otherwise at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

# DOMESTIC ECONOMY.

## House Cleaning.

"Oh, dear, here comes again the dreaded time for a general overhauling. I wonder what for things get dirty."

Poor Biddy, she has a little too much of the work that is made for man, instead of the man being made for the work.

I wonder if I were to systematize what little I know of the subject, would it lighten the load for weary backs? By way of preface I would remark that there is too much slopping on house cleaning occasions; a lady should be able to white-wash a room or wash its wood-work without spilling a drop of lime or water. Then the carpets could be taken up, returned and order restored in short metre.

"What, and let the dust settle on the clean wood and windows?"

Of two evils choose the least. Better a little extra dusting than live under the long reign of confusion that accompanies the usual method.

Then I would recommend cleaning one room at a time; those furthest removed from general usage first. Sweep carpets before taking up; send carpets and litter to the lower regions through the windows, by means of basket and rope. There again care must be taken, else the yard will look worse than the house; for this reason let carpets be shaken at a distance. Be careful and extract every tack before shaking. I have heard of three different cases of loss of sight from tacks having entered the eyes while carpets were being shaken.

### To Whitewash Ceilings

of rooms, unslacked lime is good enough; but if for the sides a mixture of whiting and glue is preferable—it does not rub off; to put it on without dropping, have a two-quart basin with only a little wash in. This you can hold in one hand without fatigue, while with the other you ply the brush. A painful becomes dirty; also you are apt to get too much lime on the brush. You will choose a square as large as the arm can ewing the brush over, dip only one side of the tip in the wash, carry this to the center of the square and paint each way. The reason is obvious; if you commence where you left off, the lappings will be whiter than the rest. Let the first coat be thick, the last thinner. Cross and recross each time on each square. Commence in a different corner the second time.

If my directions have been plain enough and you follow them, you will not drop a particle of whitewash, and there will be no droppings or brush-marks on your room ceiling. A paint brush does finer work, and is easier to learn with.

### To Clean Paint

use little water at a time; keep warm and clean by changing often; a flannel cloth is better than cotton. Be careful of soap. Put but a little soap or skim milk in the water, add soap to the cloth when needed. A sharp piece of soft wood is indispensable for the corners; the point will become like a paint brush. A saucer of sifted ashes used where paint is badly smoked or fly specks are thick, is better than soap; wipe last with clean wet towel and don't spill a drop of water. Never put soap on glass unless it can be well rinsed, which I think can never be the case with windows; wash off dirt in clean warm water and dry; then with a paste of whiting and water, and with a little cloth, place a little in the center of each pane. With another cloth rinse over the glass; next rub off with dry cloth till the window shines like crystal.

### Papering.

Don't try to paper with a carpet down. Make paste, cut bordering, and the paper, the day before. If the wall has been white-washed it must be washed in vinegar to neutralize the alkali in the lime. If papered before and you wish the paper removed, soap with water and it will peel off.

If convenient provide a long board wide as the paper, though a table or two will do. The paper must be measured, placed right side down on the board, then with a brush proceed to lay on the paste, not too thickly, but over every part, and be careful that the edges receive their share. When completed, double within three inches of the top, the paste sides being together, carry to the wall, mount your chair, and stick your three inches pasted paper on the wall at top. That holds it; now strip down the other, and see that it fits just right; if not, peel down, make right, then press to the wall from the center right and left. Leave no air under, or when warm it will expand, bursting the paper.

Of course the paper must be matched; it

will not do to measure by line unless the walls are perfectly plumb. Small figures make less waste and a small room looks the largest. Stripes make a low room higher and if there are no figures between, or in the stripe to match, there is no waste, and no trouble in putting on. If a narrow border is the style, let it be bright if the paper be neutral, but if that be bright, the border had better be dark and neutral.

If the paste be made too thick the paper will be apt to crack and peel off, if too thin, it will saturate the paper too quickly and make it tender in putting on. A counter-duster (Brussels brush), is nice to brush the paper to the wall. White clean cloths will do, but it will not do to rub the paper with this; being damp the paint or color rubs off the paper. The tables must be dried each time after pasting, for the same reason. Paste under paper must not freeze, neither dry too quickly. If whitewashing is done after papering, place a shingle next to the border, or better, tack double strips of newspaper wider than the border all around the room.—*Ex.*

**BEDS.**—These are very necessary, as well as convenient and comfortable; but like all other things in this world, there are good and bad beds. Feather beds are injurious in every way to health, and should, therefore, be dispensed with. The way in which many manage them is also very absurd; they rise from them in the morning, make them up steaming hot, close the doors and windows, all till bed-time. Then the scene is acted over again. All beds should be most thoroughly aired after being used, that the gases and odor imparted to them from the human body may be removed. The room, also, should be well ventilated. There are many materials that make more healthful beds than feathers, among which may be enumerated hair, husks, straw, springs, etc. Cotton will answer for some constitutions; but for most it is too heating. Many patients tell their physicians they cannot sleep on a bed made of cotton. It produces a restless, itching sensation, like that of insects crawling over the body. Hard beds are much to be preferred to soft ones, and that for more reasons than can here be stated.

**APPLE CAKES.**—Mix unbolted wheat or rye meal with cold water, making a dough or batter soft enough to yearly level itself. If shortening is desired, use sweet cream or butter. Fill a rather deep pie plate about a third full of the batter, and sprinkle over a little sugar. Wash, quarter and core tart apples, and place as many of them in the batter (skin side up), as it will hold. They may be pressed down and leveled with a stiff spoon. Over the top sprinkle some sugar, and bake till nicely brown.

This cake is both wholesome, nutritious and delicious. Children and grown folks can eat of it without danger of injury.

**TRICHINÆ IN THE DOMESTIC FOWL.**—Dr. G. S. Bryant reports having found imbedded in the stomach and intestines of the hen large numbers of entozoa, coiled in cysts in every possible attitude, and not unlike the trichinæ found in the human muscle. He suggests that the disease known as "chicken cholera" is dependent on the presence of these entozoa, and promises to continue and report investigations on this subject.—*Richmond and Louisville Medical Journal.*

**WILLOW LEAF TEA.**—It is announced, on excellent authority, that more than half a million pounds of willow leaf were made up at Shanghai, last season, and palmed off as green tea. The willow leaf, as prepared, cannot be distinguished from green tea by the eye; but to cover the difference in taste, it has to be mixed with tea before being sold. It can be produced at a cost of about four cents a pound, and can be used in the proportion of twenty to forty per cent. of the whole mixture.

**BAKED apples** are a very healthy food for children and grown people, and should be placed upon the table every day. Many persons are very fond of sweet apples and milk, and we must say we reckon ourselves among the number. Give us good, plain, well cooked food, in preference to fixed up dishes of conglomerated pastry.

**REFUSE lemon halves**, left after lemonade and cake-making, should never be thrown away. They will be found to have very useful properties. The cook can cleanse her hands with them, or she will find them useful for taking stains from her platters and sauce-pans.

CLEANLINESS is next to godliness.

## Mechanical Hints.

**UTILIZING WASTE OF GUTTA-PERCHA AND RUBBER.**—The waste is cut into small pieces, and 100 pounds of the same are placed in a well-closed boiler, with 10 pounds bisulphide of carbon and 4 ounces absolute alcohol, well stirred; then the boiler is closed, and left a few hours to soak. After this time it is found to be changed into a soft, dough-like mass, which, after being ground or kneaded, is fit to be formed into any shape, when the solvent will evaporate. If too much of the latter has been used, a thick, unmanageable liquid is obtained. This process was patented in England some sixteen years ago.

**CHEAP PAINT.**—A cheap paint may be made for outbuildings that will last for years, by taking milk and cement—or "water lime" as some call it; mix and apply three or four coats; any dry color may be added. This will last for years and by renewing once in two or three years, a building will look as well as if painted with oil paint. To put this on, the paint should be stirred constantly or the finer parts will all soon be used out and at last you will have nothing but sand. Have a boy to stir it all the time; mix often.

A VERY cheap varnish must, of necessity, be dear at any price, for it is certainly more profitable to use a varnish that will wear well, and save the expense of repainting; thus doing two jobs at the price of one.

**TO IMPROVE GILDING.**—Mix a gill of water with two ounces of purified nitre, one ounce of alum, one ounce of common salt; lay this over gilt articles with a brush, and the color will be much improved.

**KEROSENE** applied with a cloth to stoves will keep them from rusting during the summer. It is also an excellent material to apply to all iron utensils used about a farm.

## Thinking Promotive of Health.

It is reasonable to expect that with the improvements in mechanical appliances and the proportionate reduction of manual labor, to say nothing of the superior results secured by machinery, there would be less mental friction or excitement, and a consequent tendency to that nervous harmony which is essential to successful thought. A man being able, by the assistance of the unerring and tireless fingers of steel, to accomplish in one quarter of the time that which his unsteady hand was capable of doing before the friendly automaton lent its help, should find that cerebral calm which is not generally incident to fatiguing toil and opportunity for prosecuting studies which give breadth to the mind and perspicuity to the judgment. Thus should those who enjoy the best physical health and the happiest moral condition.—*Drayton.*

We must never fall into the delusion that the purposes of God set aside the use of means. I have heard thoughtless or captious talkers say, "If God works out his purposes, then there is no need for preaching, or any other means." Ah, simpleton that thou art, if we teach you that God works out his purposes by means, how mad must you be to charge us with thinking lightly of the means!—*Spurgeon.*

Lost wealth may be restored by industry; the wreck of health regained by temperance; forgotten knowledge restored by study; alienated friendship smoothed into forgetfulness; even forfeited reputation recovered by penitence; but who ever again looked upon his vanished hours—re-called his slighted years, stamped them with wisdom, or effaced from heaven's record the fearful blot of wasted time.

**ENJOYMENT.**—Those who are not easy at home will not find enjoyment anywhere else. The man who yawns at his own fire-side will only lacerate his jugular if he goes to a crowded city. Happiness is an internal arrangement, and if it don't bloom at home, it won't flower anywhere.

It unfortunately happens that no man believes he is likely to die soon, so every one is much disposed to defer the consideration of what ought to be done, on the supposition of such an emergency; and while nothing is so uncertain as human life, so nothing is so certain as our assurance that we shall survive most of our neighbors.

MINDS of moderate caliber are too apt to ignore everything that does not come within their own range,

## AUCTION SALE.

We will sell at public Auction, to the highest bidder for U. S. gold coin, on THURSDAY, December 28th, 1871 at W. A. Holcombe & Co.'s warehouse, the following described goods, to pay storage and advances, unless the charges are previously paid. Sale to commence at 12 m.:

A Delightful Hies.—There is the hies of ridicule, the hies of scorn, the hies of snakes in the grass; but the most delightful hies is that of

Tarrant's Effervescent Seltzer Aperient  
In the sparkling goblet, giving assurance to the invalid that his thirst will be deliciously assuaged; that his stomach will be refreshed and purified; that if he is feverish, his body will be cooled by healthful evaporation; that if he is constipated, the difficulty will pass away without a pang; and that if the condition of his general health is impaired, it will be speedily restored. Of course, he will take care to procure none but the genuine.

SOLD BY ALL DRUGGISTS.

## LUBRICATING OIL,

### THE BEST IN THE WORLD!

The attention of the public is called to GRUBER'S NEW PATENT LUBRICATING OIL.

For running Machinery of all kinds it has no equal. It will not gum, and runs perfectly smooth, cool and clean.

This OIL offers special inducements to Farmers, Livery Stable Keepers, etc.

### It will be found far Superior

To any other Oil or Grease now in use, for Carriages, Wagons, and all kinds of Farming Machinery.

Mill-men, Printers, and all others having occasion to use a Lubricator, will find a decided advantage in using this Oil—one gallon being equal to two of the best Oil in the market.

### Perfect Satisfaction Guaranteed

### OR MONEY REFUNDED.

Orders per Mail or Express will receive prompt attention.

Office and Salesroom—  
**GRUBER LUBRICATING OIL CO.,**  
Corner Drumm and Market streets, SAN FRANCISCO.

## FARMS AND STOCK RANGES,

On Government, State and Railroad Lands, IN NEVADA.

Having surveyed a large portion of the public domain in Northern Nevada, I am prepared to select, locate and obtain title for parties desiring to secure such lands, in quantities to suit, and on the most favorable terms.

Address or apply to  
A. J. HATCH,  
22v2-3msa U. S. Deputy Surveyor, Reno, Nev.

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co." is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.  
Office, 315 California street. A. J. SEVERANCE,  
CHAS. W. RANDALL,  
J. GUS. BURT.

## Notes on Contributions to Our Cabinet.\*

No. 549—Sample of Mountain cedar from Geo. Hermann, Helena, M. T. It is of fine grain, suitable for making furniture, desks, etc., and is susceptible of a fine polish.

No. 550—Specimen of crystallized sulphur, from a mine in the vicinity of Humboldt Station, Nev.; kindness of G. W. Meacham.

\*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

## New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

OUR SAVIOR'S SCANDINAVIAN EVANGELICAL LUTHERAN CHURCH.—Trustees: G. O'Hara, Taffie, C. Nelson, C. Kruger, O. W. Kling, C. Mattson, C. Thorsgrust, J. G. Nelson, T. Thomsen and J. Nelson.

SOCIETA ITALIANA MUTUAL BENEFICENZA also filed certificate of incorporation.

FRANCIS MINING CO.—Capital stock, \$1,600,000 in 16,000 shares. Trustees: A. C. Peachy, T. Bell, G. D. Roberts, J. W. Gashwiler and S. Hydenfeldt.

CENTRAL POLYNESIA LAND AND COMMERCIAL CO.—Capital stock, \$100,000 in 100 shares. Trustees: J. W. Stow, J. B. M. Stewart and J. Makee.

AMERICAN FLAG MILL AND MINING CO.—Capital stock, \$3,000,000 in 30,000 shares. Trustees: H. Raymond, A. J. Moulder, A. H. Boyden, W. H. Sears, G. W. Gage, C. B. Farwell and W. Lill.

GREAT SNOW STORM.—On the line of the Union Pacific Railroad, between Cheyenne and Laramie, furious snow storms, about ten days ago, filled up the cuts upon the track, rendering the passage of trains impossible. Some passengers were eighteen days in getting from San Francisco to Omaha; they were well cared for, however, and experienced no hardship further than delay and, in some instances, rather a scant supply of provisions. The difficulty was caused by ice forming on the track, and the snow becoming packed in the cuts almost as solid as ice. The blockade has at last been raised and large mails are coming through from the East.

KANGAROO LEATHER.—Seven thousand Kangaroo skins, from Australia, have been purchased by parties in this city, who are tanning them at a tannery, located on the northern part of Oakland, opposite Yerba Buena Island. This is the first consignment of kangaroo skins received in this market. The skin of this animal is thin, but exceedingly tough, and makes very pliable, tough, and durable leather, which turns water better than alligator leather. Boots of kangaroo leather will be a new sensation.

AOREES WITH HIM.—It is said that President Grant, since his inauguration, has gained 26 pounds in weight. "On what kind of meat is our great Caesar fed?"

A HIGH COMPLIMENT.—One of the best known and talented lawyers in San Francisco says:—"I read them all, and the PACIFIC RURAL is the best agricultural journal in the United States."

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalid use we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brix Lane, London. Export Chicory Mills, Bruges, Belgium. 1623-17

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book Keeping are taught. Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TARR, Oakland, Master Fifth Class. 269th St.

\$5 TO \$30 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Line, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowers, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12mbp

Chambersburg, Pa.

## N. Seibert's Eureka Lubricators.

## THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopper; H, F, valves to shut off in case of frost; steam does not enter the cut; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23-4f

## THE IMPROVED AMERICAN VAPOR STOVE.

No Wood, Coal, Smoke, Ashes, Stovepipe nor Chimneys, and Perfectly Safe, Economy and Convenience combined.

Latham, M. S.....	60	5	100 00
Latham, M. S.....	61	5	100 00
Latham, M. S.....	63	5	100 00
Latham, M. S.....	65	4	80 00
McDonald, J. W, Trustee			
for J. W. Gashwiler.....	71	5	100 00
Pringle, Oeo C.....	70	5	100 00
Scott, Ed, Trustee.....	69	5	100 00
Tevie, Lloyd.....	48	5	100 00

And in accordance with law and an order of the Board of Trustees, made on the 27th day of October, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 438 California street, San Francisco, California, on the 30th day of December, 1871, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expense of sale.

JOEL F. LIGHTNER, Secretary.  
Office, No. 438 California street, San Francisco, California. 23v23-4w

## Tecumseh Gold, Silver and Copper Mining Company—Location of works, Gopher District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of December, 1871, an assessment of Three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, F. J. Herrmann, at the office of the company, No. 516 Kearny street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 9th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, F. J. HERRMANN, Secretary. Office 516 Kearny street d9td.

## Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

## Alhambra Hill Mining Company—Location

of works, Alhambra Hill, Pinto District, White Pine County, Nevada.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of December, 1871, an assessment (No. 1) of 50 cents per share was levied upon the capital stock of said company, payable in United States gold coin, on the 15th day of December, 1871, to Henry C. Landis, 612 Clay street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 15th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. HENRY C. LANDIS, Secretary.  
Office, No. 612 Clay street, San Francisco, Cal. del-4w

## Altona Gravel Mining Company—Location

of works, Grass Valley, Nevada County, Cal.  
NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 31st day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Torrance, R. J. .... 293 50 30.00  
And in accordance with law, and an order of the Board of Trustees, made on the 23d day of October, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of John Middleton & Son, No. 310 Montgomery street, on the 16th day of December, 1871, at the hour of 1 o'clock p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
R. G. BRUSH, Secretary.  
Office, 314 California street, San Francisco, Cal. del-2 5w

## Pocahontas Gold Mining Company—Location

of works, Mud Springs, El Dorado County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of November, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
D. A. JENNINGS, Secretary.  
Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal. del-2 5w

## KNOWLES' PATENT STEAM PUMP.

## Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles' Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, OREGON, April 22, 1871.

Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully,

G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R. ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly,

C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly

GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully,

WM. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDAUQUA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc.,

EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELLENSTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given very great satisfaction, and that we like them better than any we have ever used.

Yours very respectfully,

G. W. WHITAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly,

P. SAULT, Superintendent.

OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc.,

JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand.

24v22-cow

## Kincaid Flat Mining Company—Location

of works, Tolueme County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of December, 1871, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Sec'y, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 17th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 17th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
R. H. CORNELL, Secretary.  
Office, 220 Clay street, San Francisco. del-4w

## Notice—The following described Certificates of Stock of the Piermont Milling and Mining Company were sold December 8, 1871, for delinquent assessment, and will not be transferred on the books of the Company—viz:

## MINING,

## And BLASTING

## POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE  
MILLS. It being constantly received and transported  
into the interior, is delivered to the consumer within a  
few days of the time of its manufacture, and is in every  
way superior to any other Powder in Market.

We have been awarded successively

## Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-  
RICULTURAL SOCIETY for the superiority of our  
products over all others.

We also call attention to our

## HERCULES POWDER,

Which combines all the force of other strong explosive  
now in use, and the lifting force of the BEST BLASTING  
POWDER, thus making it vastly superior to any other  
powder now in use.

A circular containing a full description of this Pow-  
der can be obtained on application to our Office.

JOHN F. LOHSE, Secretary.

## RICKARD &amp; DURDEN'S

## ANTI-SCALE COMPOUND,

For the Prevention of Incrustation in Steam Boilers,

[Patented July 25, 1871.]

The Cheapest and Most Effectual Material for the  
purpose ever introduced.

## STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all  
others in several important particu-  
lars. The grinding millers are near  
the center, requiring less power.  
The plow-shaped grooves raise the  
quicksilver with the pulp regularly,  
with less power, without violence,  
and with better amalgamating ef-  
fect, besides admitting of a larger  
charge. The inclined-shaped hous-  
ings of the miller-plate openings  
efficiently force the pulp directly  
under the millers.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned, or persons may apply to the inventor and pat-  
entee, Mr. C. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long  
been in constant operation.

## Hoskin's Patent Little Giant Hydraulic Pipe Joint and Nozzle.

16v23-4

The Best Apparatus for Hydraulic Mining, in the market  
Guaranteed to give satisfaction. Portable, Simple, Durable,  
not likely to need repairs, and easily repaired.

By arrangement with Messrs. R. R. & J. CRAIG, I am their  
sole licensee. I sell the only apparatus which does not in-  
fringe on any other patents. All others infringe on Craig's or  
Hoskin's, and parties found using without consent of pat-  
entees will be prosecuted.

Send for Circular and Testimonials to

## Varney's Patent Amalgamator.

## These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they  
have no equal. No effort has been, or will be spared,  
to have them constructed in the most perfect manner,  
and of the great number now in operation, not one has  
ever required repair. The constant and increasing de-  
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly  
into the pulp, or with steam bottoms, as desired.

## This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces  
the pulp to the center, where it is drawn down through  
the aperture and between the grinding surfaces.—  
Thence it is thrown to the periphery into the quicksilver.  
The curved plates again draw it to the center, where it  
passes down, and to the circumference as before. Thus  
it is constantly passing a regular flow between the grind-  
ing surfaces and into the quicksilver, until the ore is  
reduced to an impalpable powder, and the metal amal-  
gamated.

Settlers made on the same principle excel all others.  
They bring the pulp so constantly and perfectly in con-  
tact with quicksilver, that the particles are rapidly and  
completely absorbed.

Mill-men are invited to examine these pans and settlers  
for themselves, at the office, 229 Fremont Street,  
San Francisco.

## GOLD-SAVING

## Silver-Plated Amalgamating Plates

FOR MINERS AND MILL MEN,

At San Francisco Plating Works, 655 Mission  
Street, San Francisco.

By the Best of Artists,  
At this Office.

Dewey & Co., U. S. and  
Foreign Patent Solicitors  
and Counsellors, Scien-  
tific Press Office.  
Principal Agency  
for the Pacific  
States. Es-  
tablished  
1860.

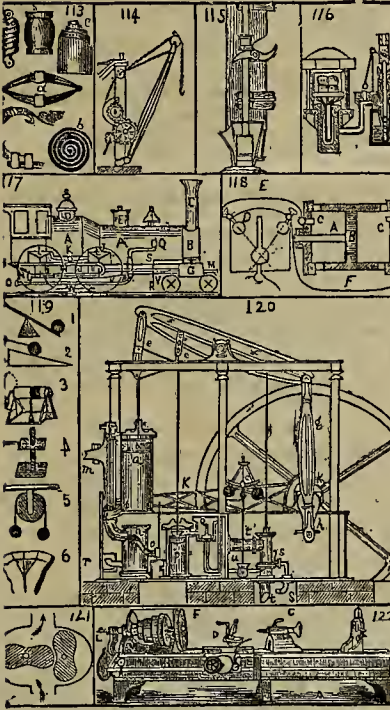

Plate V of Illustrated Mechanical Movements, described  
in Dewey & Co.'s 48 page circular of Information for  
Inventors. Sent post paid on receipt of stamp.

Patent claims for Pacific Coast Inventors  
fully secured in less time than through any  
other agency in the United States, and at less  
cost. If you think you have a valuable in-  
vention, consult none but the best and most  
reliable counsellors. They will obtain a valid  
patent if new, or save you expense, if old, by  
giving you honest and intelligent advice. All  
business relating to patent soliciting transacted  
confidentially and thoroughly.

opposite Wells, Fargo & Co.'s office, S. F.

More Patents for Mining  
Inventions

Are secured by our SCIENTIFIC PRESS Agency than  
through all other Solicitors in the United States. As  
editors and publishers of this oldest, largest and best  
practical mining journal in America, and proprietors of  
the principal Patent Agency west of the Mississippi,  
established in 1860, we have a knowledge of patented  
and unpatented devices, compounds and processes, em-  
ployed on this coast, and an experience far beyond that  
of any other Agency. Our interests are permanent and  
mutual with the Miners and Mechanics of the Pacific  
States, and they can rely on us for honest, intelligent  
and confidential advice, and reasonable charges for all  
services rendered. If you have a valuable invention, no  
matter how simple, you had better secure a good patent,  
with the least delay, through a responsible firm  
with whom you can freely and quickly communicate.  
Patent Circulars sent free.

A Reason for the High Price  
of Mining Books.

The published works relating to Mining and  
Metallurgy are very limited in the English  
language, for several reasons. Appreciative  
purchasers are comparatively few, requiring  
but small editions, therefore necessitating high  
prices. Authors who are best informed and  
most reliable too seldom are willing to devote  
the necessary attention to write works while  
their time is so peculiarly valuable for other  
pressing engagements. Hence a practical work  
like the one we issue, by the authorship of Mr.  
J. S. Phillips (a permanent resident of this  
coast), is of more than ordinary importance  
in the literary calendar of American publications.  
It is the largest volume yet published on  
Mining and kindred matters written or printed  
on the Pacific Coast. The five volumes on  
Mining and Metallurgical subjects issued from  
the office of the SCIENTIFIC PRESS since 1864,  
comprise nearly all the important and success-  
ful books of this class printed during that  
period in the United States. We mention  
these facts because, compared with common  
literary publications for general reading, which,  
if successful, reach sales of over 100,000 copies,  
the price of every book on Mining and Metal-  
lurgy seems high, while in reality it may be  
sold at too low a rate, to secure fair profit to a  
careful author, even if an unusually large sale  
is met with for each high and valuable class of  
works.

DEWEY & CO.

A NEW BOOK.

The Explorers', Miners' and  
Metallurgists' Companion.

Comprising a Practical Exposition of the Vario-  
us Departments of Exploration,  
Mining, Engineering, Assaying,  
and Metallurgy.

The Most Practical and Comprehensive Work  
on Mining Subjects Extant.

Comprising 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,  
Of San Francisco, a Practical Operator for Thirty-four  
Years, Explorer, and Resident in the Pacific States  
and Territories for the past Six Years.

Now issued and for sale by DEWEY & CO.,  
Patent Agents, Publishers "Scientific Press."

General Analysis of Contents.

Section I.—GEOLOGY AND MINERALOGY.

CHAPTER I.—Formation of the Earth, from its initial o-  
catic state to the time of the partial elevation and solidifica-  
tion of its primitive granitic mountains.

2.—Formation of the first clay slates, greenstones quartz-  
ites, hornblendes, and various fine-grained feldspathic mix-  
tures, from primitive rock elements.

3.—The rock formations of the Paleozoic, Mesozoic, and  
Cenozoic times; wherein the footprints and fossiliferous re-  
mains of animated nature unfold evidence of their presence  
and progressive continuance, from first mere existence to  
perfection.

4.—Theory of Earthquakes; the mighty powers that have  
fractured some of the mineral sections of the earth's crust  
into separate belts of rock, within the opening walls of  
which the minerals have been since deposited.

5.—Formation of Veins; of the "True fissure veins" in the  
Azoic and metamorphosed Paleozoic rocks. Of converging  
and wedge veins in the convex upper sections of up-  
heaved bed-rock. Of veins that are more or less conforma-  
ble to the general cleavage of tilted stratum, in the seams  
of which the matrices, minerals and metals have been de-  
posited. Of veins that intervene and separate two distinct-  
ly different strata, as granite and slate, slate and limestone  
etc. Of gas veins. Of cross courses. Of slides. Of  
dikes. Of carbonates, bonanzas, pockets, and floors. Of  
irregular sublimations, alluvial distributions, and sedi-  
mentary deposits.

6.—The supposed actions and reactions that have been and  
are continually taking place in mineral veins, pockets and  
deposits. How minerals were formed. How gold, platinum,  
and other similar metals were formed.

7.—The peculiar characteristics of "True fissure veins"  
and their constituent combinations. Positions, directions,  
and dips. General comportment when traversing different  
strata, when forming intersections and junctions with each  
other, or with cross courses, dikes and slides. Contrac-  
tions and general influence of cross courses, slides, and  
dikes. Summary of the effects produced by collective  
causes.

8.—The more generally recognized premonitory indica-  
tions, in the shallow portions of veins, for probable increase  
of mineral in depth.

Section II.—EXPLORATION.

CHAPTER I.—Prospection.

2.—How to explore.

3.—Where to explore.

4.—The peculiar kinds of the primitive and secondary  
rocks, that concern the miner, as being most congenial for  
rich veins; and what formations should be avoided.

5.—The prospector's and locator's preliminary exposition  
of the general features of a vein, so as to ascertain its ap-  
proximate value, previous to location and development by  
the miner.

Section III.—ASSAYING AND DISCRIM-  
INATIONS.

CHAPTER I.—Systematic preparation of the sample, to ob-  
tain average quality, for discrimination or assay.

2.—Description and general advantages of the "explorer's"  
miner's, miller's, and smelter's friend, the portable, "wee  
pet" assaying machine.

3.—New methods for the examination and assay of ores, by  
water-washed concentrations, sometimes perfected by acid  
solutions, or mercury, and completed, when necessary, by  
roasting, and fluxed fusion, with crucible, scorifier and ma-  
chine.

4.—The methods for discrimination, by blow-pipe or assay-  
ing machine, of such of the metals, metallic minerals, and  
earths, with their combinations; that should be known by  
the explorer, miner, miller, smelter, assayer, and metallur-  
gist for ores.

5.—Discrimination of the profitably useful minerals, by a  
new method, for practical men.

6.—An alphabetically arranged record of the effects pro-  
duced by water and fire, sometimes assisted by water and  
chemical re-agents on the minerals and such of their com-  
pounds as will be practically useful and profitable to the ex-  
plorer, miner, and metallurgist.

7.—Assaying of gold and silver, by ten different methods.

8.—Assaying of Lead.

9.—Assaying of Antimony.

10.—Assaying of Copper, by acids and by fire.

11.—Assaying of Tin, by water, acids, and fire.

12.—Assaying of Mercury.

13.—Assaying of Iron.

14.—Assaying of Manganese and Zinc.

15.—Assaying of Coals.

Section IV.—MINING AND ENGINEERING.

CHAPTER I.—Education of a Mining Engineer.

2.—Systematic and more extensive excavations, for the  
examination of the supposed rich vein.

3.—Mechanical Engineering, above and below the surface.

4.—The Cornish hydraulic engine; steam-pumping engine;  
pumps, etc.; hand and steam capstan, hoisting machines,  
tram-roads, and man engines.

5.—Deep mining, as facilitated by such machines.

6.—The Cornish crushing, stamping, running, jigging,  
budding, dressing, and roasting machines.

7.—Dry and wet concentration of ores, by hand, water, and  
acids; and by calcination.

8.—Preparing and sampling the ores for the market, etc.

9.—Contracts, setting, paying, and account days.

10.—The most important and more frequently recurring  
errors in mining, which may be more easily avoided than  
committed.

Section V.—METALLURGY.

CHAPTER I.—Roasting.—Roasting of peculiar ores, to re-  
duce their weight for cheaper conveyance to the market.  
Roasting refractory milling ores. Roasting to obtain the  
volatile element, in marketable purity. Roasting prepara-  
tory to chlorination, or other chemical reduction. Roasting  
for slags.

2.—MILLING.—By battery, with water and mercury. By  
battery, dry, for after treatment; by roasting and pan amal-  
gamation, by chlorination with Plattner's process, or other  
chemical manipulation. Milling with iron pans in copper-  
bottomed pans; in arastras; in the Chilian mill; and with  
close revolving barrels.

3.—CHLORINATING.—Plattner's original method. Furnace  
chlorination, etc.

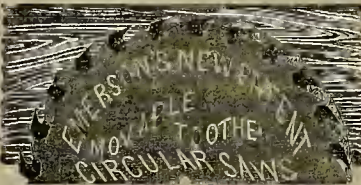

4.—SMELTING.—Smelting by natural draught, in reverber-  
atory furnaces. By blast in cupola furnaces. By various  
extensive methods.

CHEMICAL REDUCTION.—By several of the best known  
methods.

PRICE, bound in cloth, \$10 (in coin or its equivalent).

Number 25.

## EBERHARDT AND AURORA MINING COMPANY.

The Eberhardt and Aurora Mining Co. own some of the principal mines on Treasure Hill, White Pine. The whole property amounts to 1,939 feet in all, of which there are 300 feet of the Ward Beecher, 839 feet of the North Aurora, and 800 of the Eberhardt mine. Patents have been obtained on the North Aurora and Eberhardt, and a patent has been applied for on the Ward Beecher. Our special correspondent, Mr. Murray, while on a visit to White Pine a short time since, visited the mines of the company and elicited a few points which may be interesting to our readers.

Of our illustrations, Fig. 1 represents a ground plan and Fig. 2 a longitudinal section of the mine. The most northern ore chamber, which is worked to the surface, is in the Ward Beecher claim. This chamber is 245 feet long, and 40 feet wide. The whip shaft *e, f*, is 76 feet deep. The chamber runs north and south. There are about 23 men on each shift at work in this chamber, and three shifts are run. There are only two heavy timbers to support the roof—all being a capping of solid lime rock. The general character of the ore is horn-silver and chlorides, resembling the old Eberhardt rock. The Ward Beecher lies between the Hidden Treasure and South Aurora mines.

The shaft in the "Ladies Chamber" is 122 feet deep, and the chamber is 50x175 feet. Depth from surface to floor 122 feet. From the floor to the dome, inside, is 55 feet perpendicular. It has been worked out in this shape to give it a form that will stand safely without timbering. The name was given to this chamber in honor of Mrs. Phillpotts, wife of the superintendent, who was the first lady ever down in the mine.

The ore in these workings continues down below the floors and the whole dips to eastward at an angle varying from 30° to 45°. The width of the deposit will average 40 feet. There are six shafts as represented in the cuts, and about 130 tons of ore are hoisted per day from the Eberhardt, North Aurora and Ward Beecher mines. About nine-tenths of all the rock taken out is good ore. The ore is hoisted out by steam and horsepower, which operation we shall endeavor to illustrate in a future issue. The 20-horse power engine for hoisting is the only one used for that purpose on the hill.

On taking hold of this property the English company sunk deeper, and worked further to the east, and found the continuation of the ore body worked by the former owners. A slide seems to have occurred on the hill from east to west, which carried the croppings a distance of 37 feet, misleading the miners as to the location

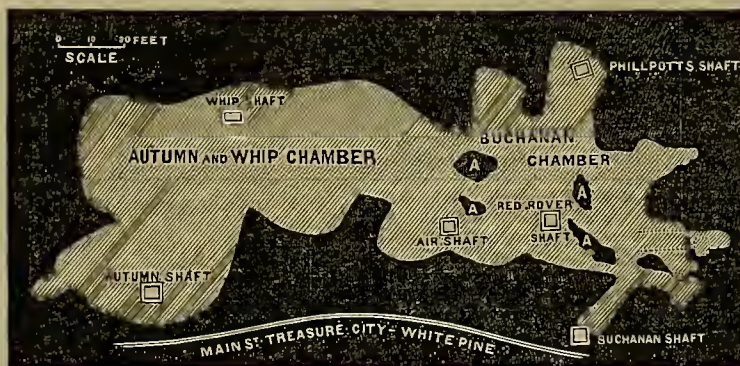

of the main body of the ore. The present owners have shown very good judgment and engineering skill, and proven that the ore in these large deposits runs down to an indefinite depth.

The deposit runs from the north to the south end of the hill dipping at an angle of 32 degrees, and is bounded on the west by a large spar vein dipping to the east at the same angle. This spar seam evidently forms the western boundary of the main ore-channel, running north and south in this hill, and Chloride and Bromide flats appear to be overflows from it, with small

A 16-horse-power engine at that place furnishes the power for passing the wire rope around the drum, the buckets passing up one line and down the other. The steel wire is suspended on posts, the highest of which is 130½ feet.

When first put up, it was found that the expansion and contraction of the wire and other causes made it difficult to operate, and some alterations were necessary. The tightening pulley was taken from the hill and placed below, where the slack was. The buckets carry 200 pounds of ore each at a trip, and the ore can be landed at the

Fig. I.

SECTIONAL GROUND PLAN.

east and west cross sections that vary from two inches to 20 feet.

This spar seam has some of the characteristics of a true fissure. Its structure may be termed banded, being made up of narrow bands or layers running parallel with the walls. The limestone strata have

mills below for a cost of from 75 cents to \$1 per ton. The tramway runs down Mahogany Cañon and over a very rough, precipitous ravine. It is the largest one of the kind in the United States, and the curves are easily passed; so that it answers the purpose of a railway, without the

Fig. II.

LONGITUDINAL SECTION.

a nearly corresponding westerly dip, showing that the spar seam cuts the limestone of the country rock almost at right angles.

In the Ward Beecher, the first ore was found at a depth of 80 feet. Although not so rich as the Eberhardt was in its best days, it far exceeds that famed mine in the quantity of high grade ore already produced, as well as that in sight.

The tramway belonging to the company, for the purpose of transporting ore to the mills at Eberhardt city, below, is one of Hodgson's patent, and 11,000 feet in length. The elevator at the top is 9,150 feet, and at Eberhardt city, the lower end, 7,150 feet.

necessity of embankments, tunnels or bridges. As it works at present it is a complete success, although it was a difficult matter to get it in successful operation. The whole cost was about \$120,000. A telegraph line runs up the hill, for convenience in signaling.

The company own two mills, the International and Oasis. The former is crushing at present about 80 tons per day, and the latter about 12. In the International there are two large engines, respectively 150 and 125 horse-power, to drive the stamps, pans and settlers. There are six large boilers to furnish steam for the engine

and pans. The mill has 60 stamps, 22 pans, 11 settlers and 3 agitators. The arrangements are very complete for doing the work, the pulp being taken from the batteries to the pans in cars. Stanford's patent self-feeders are also used. The Oasis mill has 10 stamps and 10 pans.

The Eberhardt and Aurora mines were purchased by this company for £150,000, and the Ward Beecher for £10,000. The International mill cost £51,024. The principal office of the company is in London, but a nominal one is established in this city.

Mr. Thos. Phillpotts is engineer and general manager; Mr. Williams, of Virginia City, milling superintendent; Jos. Potts, chief foreman of the mines on the hill; John McChrystal, foreman of the North Aurora; Wm. Davis, of the Ward Beecher, and John Goodfellow, of the Eberhardt. A large amount of money has been expended in developing these mines, and in mills and other improvements connected with the enterprise, showing that when our friends over the water do take hold of anything, they intend operating it in a thorough and systematic manner. The operations of this company have given new life to White Pine, and every honest encouragement should be given to English capitalists to invest in our mines on the Pacific slope, since they are likely not only to benefit particular localities, but the country at large.

**IMPROVED STREET CAR.**—The Omnibus Railroad Company, of this city, is about to put upon their lines a new kind of cars, which will obviate the necessity of having a conductor. A glass box is fixed in the front end of the car and the passengers deposit their fare or tickets therein in sight of the driver, who turns a crank, which throws the money from a shelf into the bottom of the box. This improved fare box has been invented by a gentleman in this city, and is said to be more simple and convenient than any now in use. It is already in use in Oakland and is said to work successfully. The cars will be smaller than those now in use, so that one horse will be sufficient

to do the hauling. The new car will be connected with the truck in such a manner that it can be turned on a central pivot or kingbolt without detaching the horse when the end of the line is reached. There are no platforms, entrance to the car being effected by means of a step at the door in the rear, just like the old-fashioned omnibus. These one-horse cars are used in several Eastern cities, and in New Orleans none others are in use. Several cars of the new pattern are being constructed and some of the old ones will be altered.

THE SHAFT on the Gould & Curry mine is down 1,500 feet—the deepest one on the continent.

# MECHANICAL PROGRESS.

## Fire-Proof Roofs.

Wiseacres theoretical, and practical men with hobbies to ride or axes to grind, have written elaborate articles on the merits of Joliet marble, Lake Superior granite, good lime, iron-joists, iron-shutters, etc.; but very little has been said about tar and gravel roofs, and galvanized iron cornices with wooden backing.

It has been claimed, that the tar, felt, and gravel covering, is absolutely fire-proof. The genial tar and gravel-roof builders will tell you so, and produce certificates from John Smith, William Jones, Richard Roe and other respectable citizens whose places of residence cannot be found on the latest postal route map, to the effect that they were present when an attempt was made to burn a fire-proof tar and gravel roof, of John Doe's patent. Mr. Doe is anxious to have you see for yourself; builds the roof and puts on a coating of gravel from an inch and one-half to two inches thick. The experiment proves an apparent success. Six or eight months or a year later, after the heavy rains shall have swept a large quantity of the gravel down the water-spout, examine the roof. Square yards of the roof will then be found to be as bare of gravel as an ostrich egg of hair. Black, ill-smelling pitch, blisters and swells, and gradually melts in the summer sun. A burning brand from a fire two blocks away lights on the roof; a gentle wind fans the flickering blaze into a ruddy glare; the house burns from garret to cellar, and the whole disaster is attributed to Providence, with rather indefinite allusions to Sodom and Gomorrah.

The galvanized-iron cornice, with the wooden backing, is another gigantic fraud. The Pacific Hotel, in Chicago, was ornamented with one. Wooden strips were inserted in the walls, and to these was tacked the galvanized iron. An exposed corner, where two or three inches of this wooden backing were visible, was seized upon by the fire on the fatal Monday morning, and in a few hours the proud building was gutted from top to bottom. The wooden strips, or cornice backing, communicated with the joists of the roof, and the building went down.

What is, then, a fire-proof roof? We answer: a roof made of tiles. These tiles can be made of good clay, laid in cement, or else of artificial pavement, similar to that put down last summer at the north-west corner of the Court House square. They are non-conductors of heat, and neither expand nor contract with the changes in our temperature. Being smooth, every rain storm washes them as clean as if done with a hose. Fire-brands are powerless to crack them; the wind cannot loosen them; snow drifts can be swept off as easily as from the pavement. They are impervious to weather, and are no more destructible by fire than a well-burned brick.

Galvanized cornices, where anchored to wooden strips in the wall, should be summarily condemned, and instantly removed by the fire authorities, and iron rods substituted for the wooden plates. Tar and gravel roofs should be rigorously prohibited from the fire limits, and, like shingle roofs, their use should be limited to isolated risks in the suburbs, or in the country.

Some experiments have lately been made at Sandy Hook, for the purpose of solving the problems involved in steam-boiler explosions. The experiments were highly interesting in themselves, and promise some excellent practical results. A boiler constructed exactly on the model of the one which burst on the Westfield, out of precisely similar iron, and as nearly as possible the counterpart of it, required a pressure of nearly two hundred pounds to the square inch to explode it, while that of the Westfield was carrying but twenty-seven pounds five minutes before the explosion, with its safety-valve weighed to thirty-five pounds.

**WANTED—STONE-QUARRYING MACHINERY.** In speaking of the stone quarries in the neighborhood of New York City, the *Times* says: "What is most wanted in these quarrying regions is a little more enterprise and tact; men who can invent and apply approved methods for handling and working stone. The problem of transportation also needs an infusion of brains and energy. Capital is also needed, but that is fast coming and will soon be plenty enough."

## Improvement in Architecture.

The earliest periods were characterized by the utmost simplicity of invention and construction. Later, the efforts for defence from enemies and for architectural display, which have always employed so much time and power, began to be made. The megalithic period has left traces over much of the earth. The great masses of stone piled on each other in the simplest form in Southern India, and the circles of stones planted on end in England at Stonehenge and Abury, and in Peru at Sillustani, are relics of that period. More complex are the great Hymyaritic walls of Arabia, the works of the ancestors of the Phœnicians in Asia Minor, and the Titanic workmanship of the Pelasgi in Greece and Italy. In the iron age, we find granitic hills shaped or excavated into temples; as, for example, everywhere in Southern India. Near Madura the circumference of an acropolis-like hill is cut into a series of statues in high relief, of sixty feet in elevation.

Easter Island, composed of two volcanic cones one thousand miles from the west coast of South America, in the bosom of the Pacific, possesses several colossal ent from the intrusive basalt, some in high relief on the face of the rock, others in detached blocks removed by human art from their original positions and brought nearer the sea-shore.

Finally, at a more advanced stage, the more ornate and complex structures of Central America, of Cambodia, Nineveh and Egypt, represent the period of greatest display of architectural expenditure. The same amount of human force has perhaps never been expended in this direction since, though higher conceptions of beauty have been developed in architecture with increasing intellectuality.

Man has passed through the block and brick building period of his boyhood, and should rise to higher conceptions of what is the true disposition of power for "him who builds for aye," and learn that "spectacle" is often the unwilling friend of progress.

No traces of metallic implements have ever been found in the salt mines of Armenia, the turquoise quarries in Arabia, the cities of Central America, or the excavations for mica in North Carolina, while the direct evidence points to the conclusion that in those places flint was exclusively used.

The simplest occupations, as requiring the least exercise of mind, are the pursuit of the chase and the tending of flocks and herds. Accordingly, we find our first parents engaged in these occupations. Cain, we are told, was in addition, a tiller of the ground. Agriculture in its simplest forms requires but little more intelligence than the pursuits just mentioned, though no employment is capable of higher development. If we look at the savage nations at present occupying nearly half the land surface of the earth, we shall find many examples of the former industrial condition of our race preserved to the present day. Many of them had no knowledge of the use of metals until they obtained it from civilized men who visited them, while their pursuits were and are those of the chase, tending domestic animals, and rudimentary agriculture.—*Prof. Cope, with Modern Scientists.*

**ECONOMY IN STEAM POWER.**—A Boston correspondent of the *American Artisan* states that he is running a twenty-horse engine constantly with the heat obtained from the exhaust steam of another twenty-horse engine, thereby doubling the amount of power previously produced by the consumption of a pound of coal. The apparatus used consists of a tubular boiler, twenty-six inches in diameter and ten feet long, with sixty 1½-inch iron tubes in it. This boiler is placed in an upright position and filled half full with bisulphide of carbon, and is heated by passing the exhaust steam through the tubes, from top to bottom. The steam is completely condensed in passing through; and the temperature of the water of condensation discharged at the bottom of the boiler does not exceed 120° Fahr. at any time. The latent heat of the steam is absorbed by the bisulphide of carbon, which is converted into vapor very rapidly under a pressure of fifty pounds to the inch. This vapor is used to drive the second engine, which does as much work as the first is doing. The bisulphide vapor after being used is condensed by passing through a coil of iron pipe immersed in water, and is pumped back into the bottom of the boiler as fast as condensed, and used continuously, the waste not exceeding half a gallon per day. Only forty gallons are required to work the engine successfully.

# SCIENTIFIC PROGRESS.

## Artificial Volcano.

Dr. Fred. V. Hochstetter furnishes an interesting account of a phenomenon occurring during one of the phases of a manufacturing operation, which is, as he claims, a complete duplicate, upon a miniature scale, of a volcanic eruption; and which serves, at the same time, to confirm the modern views concerning the process of an eruption; according to which the lava is not simply in a molten condition, but is reduced to the state of liquidity by the action of superheated water vapor under great pressure.

The phenomenon referred to occurs in the operation of separating the sulphur from the residual products obtained in the manufacture of soda by Leblanc's process. The sulphur obtained from these residues, in order to free it from the gypsum or sulphate of lime mixed with it, is melted in a suitable apparatus, with steam under a pressure of from 2—3 atmospheres. The gypsum remains suspended in the water, and the fused sulphur is from time to time run off into wooden troughs or forms, the temperature of the fluid mass being about 122° C. (251.6° F.). Almost instantly after the pouring, a crust of solid sulphur is formed on the surface of the mass. Dotted over this surface, however, the orifices are left, from which the liquid beneath is forced up. At intervals a jet of sulphur bubbles out, and cooling, forms around the orifice a slight prominence; the repeated eruptions accumulate material about it, until a miniature volcanic cone is formed, with its crater well defined.

The cause of this curious phenomenon is found in the fact that sulphur, in its fused condition in the steam chamber, takes up and retains a certain quantity of water; and this absorbed water, it appears, is given out gradually in the form of steam, as the sulphur solidifies. The slowly liberated steam, accumulating pressure beneath the crust of sulphur, forces, at regular intervals, an outlet at the vents, carrying with it in its passage the molten material to form the solid cone.

**SOUNDS FROM THE AURORA.**—It has long been an article of popular belief that the aurora is a roarer; that is, that it produces a sound more or less distinct. Scientific men, however, have generally been inclined to regard this auroral noise as a mere illusion. Loomis, in his excellent "Meteorology," says: "There is no satisfactory evidence that the aurora ever emits any audible sound. The sounds which have been ascribed to the aurora must have been due to other causes, such as the motion of the wind, or the cracking of snow and ice in consequence of their low temperature." But in a paper read at a recent meeting of the Academy of Science, of Paris, M. Becquerel expressed the opinion that the aurora really does make a noise, and in support of this view quoted the observations of Paul Rollier, aeronaut, who started from Paris in December last, and descended 14 hours after in Norway on Mount Ide, at an elevation of 4,000 feet; "I saw through a thin fog the moving of the brilliant rays of an aurora borealis, spreading all around its strange light. Soon after an incomprehensible and loud roaring was heard, which, when it ceased completely, was followed by a strong smell of sulphur, almost suffocating."

**COPYING PICTURES BY COLLODION.**—According to Mr. Kleffel, if a glass plate be coated with collodion in the ordinary manner, and, after the liquid has set, a piece of printed paper be pressed lightly upon the surface by the hand, a very exact reproduction of the letters or figures will be found impressed upon the collodion when the paper is removed, the design remaining perfectly visible after the complete drying of the film. It is suggested that this may be the germ of some important applications in the way of the reproduction of printed matter, without injury to the original.

**HYDROCHLORIC ACID AS AN ANTISEPTIC.**—A piece of meat, immersed for fifteen minutes in a mixture of one part of the acid to three of water, remained entirely free from putrefactive change after nearly a fortnight, though the action of the acid was not sufficiently powerful to prevent the appearance of a small quantity of mold. The meat was then immersed in a dilute solution of carbonate of soda, and the superficially absorbed acid thus converted into common salt.

**THE OPAL UNDER THE MICROSCOPE.**—At a late meeting of the Imperial Academy of Sciences in Vienna, Professor von Hochstetter communicated some microscopic investigations on opals, by Dr. H. Behrens, in which the author states that most opals are mixtures of various minerals, including a colorless fundamental mass, containing (microscopically discoverable), hydrophane-cacholong, quartz, hydrated and anhydrous oxide of iron, feriferous silicates, metallic sulphurets and carbonates, and organic substances; fire opal, glass-opal, noble-opal, and hyalite are free from admixture, and the first two are structureless. The colors of the noble-opal are interference-colors, caused by lamelle, which, however, are not tabular crystals. The double refraction discovered by Schultze in hyalite is caused by differences of elasticity such as occur in dextrin, amber, and compressed glass. The author also noticed the spheroidal structure which frequently occurs in opals.

**FLOATING OF SOLID IRON ON MOLTEN IRON.**—The following explanation of this paradoxical phenomenon is given in the *Scientific American* as a plausible one, to say the least: "According to the dynamical theory of heat, the molecules or particles of heated metals are in a state of great agitation, and the higher the temperature, the intenser the molecular motion. The difference in the specific gravity in melted and solid cast-iron being slight (as 31 to 32 nearly), this constant and fierce movement of the particles of the former prevents a block of the latter from sinking. An analogous action is found in swift running streams or eddies, upon which bodies of considerably greater gravity than water are supported for a long time, and also in the partial suspension of an egg in boiling water."

**A NEW GAS.**—M. Rouille Paris proposes a new method of gas-making, by which the article can be produced economically and with the simplest apparatus in houses, manufactories, etc. The inventor has given to this new illuminating agent the name of "gas autogene." It is formed of air and steam of essence of Petroleum. The apparatus is described as not only very simple, but as occupying only a very small space. An apparatus for example for the supply of 1,000 burners does not require more than a square yard, and for a less number in proportion. The gas is said to give a much more brilliant light than ordinary gas and to be much cheaper—in fact, that half a cubic yard of "gas autogene" gives as much light as a cubic yard of ordinary gas, and that it costs only three cents per cubic yard.

**HEARING IN LARGE CHURCHES.**—This is now made as easy as in the smallest, by the success of an experiment lately put in successful practice in Trinity Church, New York. It consists of a paraboloidal reflector of sound, placed at the back of the pulpit, of which the speaker's mouth is the focus. A beam of sound about ten feet in diameter is thus thrown to the most remote point of the church, and by its flow fills the whole body of the building. The structure is quite ornamental, and in harmony with the general architecture of the whole building. All great public buildings, whether for singing or speaking, may have similar arrangements adapted for their use. A person standing at the farthest door in Trinity Church can carry on a conversation with one in the pulpit, in the lowest tones, even in a whisper.

**THE SPECTROSCOPE AND THE NEBULAR HYPOTHESIS.**—Prof. Kirkwood says that the spectroscopic has demonstrated the present existence of immense nebulous masses such as that from which Laplace supposed the solar system to have been derived. It has shown, moreover, a progressive change in their physical structure, in accordance with the views of the same astronomer. In short, the evidence afforded by spectrum analysis in favor of the nebular hypothesis is cumulative, and of itself sufficient to give this celebrated theory a high degree of probability.

**PURIFYING BENZOLE.**—According to Professor Hoffman, benzole can be purified more readily than in any other way by first freezing it, and then subjecting it to pressure. For this purpose, it is placed in a tin or brass vessel, in which an iron rod having attached a close fitting piston perforated with numerous small holes is made to play. On forcing this down, the liquid portions are separated and can be drawn off, and on melting the frozen benzole, the hydrocarbon is obtained in a state of purity.

## CORRESPONDENCE.

### Mills and Mines at Dun Glen, Nevada.

EDITORS PRESS:—As I see, you request miners in different localities of the country to write you, and that this section shall not rest entirely dead, I have concluded to drop you a few lines from here. This section is at present only noted for having some good mines, dead mills and a possible revival. It is really a good mining camp, however, and is weekly advancing.

The Tallulah mine, 3 miles from here is one of considerable merit, the lode being some 3 to 4 feet in thickness. Considerable good ore has been extracted and shipped, which has paid as high as \$500 per ton. This company is now running a tunnel which will tap their lead some 300 feet from the surface.

The next mine of proportions and merit is the Old Lang Syne, owned by Sprague & Co. This mine has been worked by several companies, but with indifferent success, though the ore is in goodly quantities and of good quality. Sprague & Co., in order to overcome past difficulties have erected a 6-ton mill to work by the Paul process. The first test of several tons of ore from the Wentworth & Wright mine which is exactly of the same character as Lang Syne, worked by the process gave returns so far exceeding every one's ideas of the value of the ore that it has tended to give renewed life all around, and the mill is now having an addition of more machinery connected with this new process.

There being so much talk about the mill, I visited it a few days ago and had the pleasure of meeting Mr. Paul, the inventor, who is here seeing to the working and erection of the machinery. To give a description of the mill I hardly know how to begin, excepting to say that it is run by steam power, the cylinder being 12-inch bore and 36-inch stroke. The ore is reduced by a crusher and pulverized in a barrel which runs under heat and of such construction that it feeds itself and discharges as fast as reduced. From this barrel the ore goes into a hopper where that which is fine enough passes into a hopper to be amalgamated. From the hopper it goes into an iron amalgamating barrel about 3 feet in diameter and 5 feet long; only ore and quicksilver go into this and some chemicals; no water is allowed. So you see it is dry work so far. The ore after being thus amalgamated goes into a settler where the mercury is precipitated. To give a full description of these settlers and discharge of mercury which carries all the metal, would make more of a letter than you might want to publish. It is a settled fact, however, that the process does the business and Messrs. Sprague & Co. deserve the thanks of the mining community for having the enterprise to start in to overcome past trouble, and it is to be hoped they will be amply rewarded. As soon as the machinery now here is all in, the mill starts up on ore from Lang Syne and other mines.

There is another mill about a mile from Dun Glen known as the Essex Mill, which has laid idle for about a year because it would not pay to run it. This mill has steam power and pans as amalgamators, but with all the skill in amalgamating it could not work the ore satisfactorily. Mr. Paul worked some of the same ore as worked by this mill and his returns were \$3½ to every \$1 obtained by their pan working; and, while their bullion was base, Paul's was finer than coin by 65-1000. Mr. Paul's work thus far has exceeded even his own representations. There is nothing superfluous about it. The mill is very plain and handy without intricacy. Thus renewed life is being given to the district. A number of miners have started in working their old claims, and re-locations are weekly being made, for two reasons: First, they have a mill where they can get their ore worked; and, secondly, can get the metal out. I should not be surprised if in the next six months Dun Glen became a very lively camp. The ore here is a combination of gold, silver, lead, iron, and more or less arsenic and zinc.

The metal is principally gold, though there are some leads which carry considerable silver. There is a good show for

miners to get claims to work themselves; rich strata which will pay two or four men good wages.

Dun Glen is 9 miles from Mill City Station, C. P. R. R., contains one hotel, one store—Sprague & Co.'s—some 15 buildings, and at the same time several subscribers for the PRESS, which is ever welcome in a miner's cabin. HUMBOLDTER.

Dun Glen, Dec. 12, 1871.

### Mines Near Austin, Nev.

EDS. PRESS:—The mines at Austin are looking well, and more ore is coming out than there has been since the discovery of the district. It is destined to be a camp of considerable importance. At

Belmont,

the mines are very good, but the people are behind the times; the mines are opened in a very rude way. The most important ones are the Monitor, Mullen, Arizona, Canfield and Martinez, which are all doing well. There are two mills here, but only one running at present; it has a Dunderberg furnace. The bullion is very coarse, however, and the proprietor intends putting in a White furnace in the spring.

San Antonio

is about 30 miles south of Belmont. There are three companies working—the Grimes, St. Louis and Coten—all doing well. The ore is shipped to Austin to be worked. A mill is needed badly. I next visited

Montezuma,

fifty miles south. It is a flourishing camp of about 260 inhabitants, with the best working mines I have seen. The camp was started by McGlew and Dawley, who are well known in Nevada as millmen. They built a 10-stamp mill, which, for convenience, I think is the best I have seen in my travels, and is a model in its line. I understand from Mr. Dawley, that the property is about to change hands, at a satisfactory price, to a San Francisco company. The town is situated near the mill, on the western slope of the mountain, and has about fifteen houses. Jeremiah Miller, from White Pine, is the agent of the new company that propose to purchase the mill; he is well known as an expert millman, and is remarkably well pleased with Montezuma.

Silver Peak,

fourteen miles southwest of Montezuma, has a 30-stamp mill and some good mines. The mill at present is stopped for repairs, but will start up in the spring. I am informed a new 20-stamp mill is to be erected in the spring. J. A. W.

Austin, Dec. 6th.

### Smelting and Milling in Utah.

EDS. PRESS:—The manner of conducting these operations in this Territory has not led to the success which the extent and magnitude with which they were undertaken, promised.

The present unsatisfactory state may be partly accounted for by much of the ore being of a refractory nature, some of it being undoubtedly highly so; but the non-success or temporary failure may now justly be imputed to the desire of the operators to save first costs, and make their furnaces and mills do double duty—to both calcine and smelt, to chloridize as well as mill.

A better understanding of the requirements for success seems to be fast gaining ground, and Walker Bros., finding that their mill in East Cañon lost \$120 [per ton?] in the slimes, have suspended operations until the furnace in course of erection by Mr. Akin, of Nevada, is ready to calcine and chloridize the ore, which is not free-milling, but largely containing sulphides.

Of the smelters, the one at Diamond City, Tintic, has never even worked well; the ores used are considered the most refractory in the Territory, and it is now shut down, deeply involved in debt, to await further experiment. The Homansville smelter, also in Tintic, after continuously running for four months, has ceased operations for the winter. The want of ore of sufficiently high grade to make the working pecuniarily successful, is said to be the cause of suspension. Of the other sixteen smelting establishments in the Territory, those in the Cottonwooda, Stockton, and Bingham Cañon, have alone met with any success. Some have suspended temporarily; others have made due prepa-

rations by laying in a stock of fuel and various grades of ore for carrying on regular operations during the inclement season. The works of the Utah Silver Mining Company, better known as the Buel and Bateman, have closed for the winter, owing to the want of success attending the working of low-grade galena ores of the district without previous concentration and calcination. When the working capital of this company is increased, as it is expected it will be, and the mine properly developed and a calciner built, it is confidently expected that success will attend the working of these low-grade ores. It is earnestly to be hoped that these expectations will be realized, for upon the ultimate success of this venture largely depends the placing of much Utah property on the London market. H. S. Salt Lake City.

### Helena, M. T.

Helena is the metropolis of Montana Territory, and a thriving, busy town. I made quite a stay while there; visited the Agricultural Fair, etc. A company was formed during my visit, for the purpose of erecting reduction works, which have since been completed. These works are not only of local importance, but are of benefit to a large section of country.

Silver Mines.

Several hundred miners find employment in working the numerous silver leads in the surrounding mountains, and a number are prospecting for more; and from the considerable number of rich silver leads known to exist within a few miles of the city, and already sufficiently developed to demonstrate their value, I think that a number more will yet be found, which will doubtless make the reduction works a success. The buildings of the

Smelting Works

are 75x66, and 30 feet high, constructed of wood. There are four furnaces, with a capacity of working about 20 tons of ore in 24 hours. These furnaces are nine feet square and 40 feet high. Besides these, two cupel furnaces, for refining the bullion, are used. The engine is 40-horse power, and one of Root's blowers, No. 4, is used. At the time I was at Helena, 25 hands were employed, and charcoal was 17 cents per bushel; wood, \$4.50 per cord. The furnaces are built on the Castilian plan. Mr. Rumley, the efficient Superintendent, is sure to make the enterprise a success. This is a stock company, and the shares are all held by the citizens of Helena. Mr. Bohm has leased the works from the stockholders, his works at Argenta having been a success, which has encouraged him to take these.

The Park Ditch,

an enterprise which has been much talked of, is for the purpose of increasing the supply of water and making the placer mines more productive. It is under the direction of Col. A. M. Woolfolk, its principal owner, who is Superintendent. The dams at the Park lake are being strengthened by heavy timber work and raised one and a half feet. An artificial lake, one and a half miles long, is being constructed about a mile above. This new lake will hold about 30,000 inches of water, miners' measure. The delays in the completion of the ditch this winter caused the enterprise to fall below general expectations, but the new improvements will make it answer all requirements.

A steam flour mill is about to be erected in Helena, which will supply a want long needed.

The Getchell Claim,

in Last Chance Gulch, a short distance from town, embraces 600 feet on one side of the gulch and 900 on the other. It was purchased last July by a company of 17 Chinamen, who make about \$1.75 per day out of it—good wages for them. The gulch on which this claim is located is well known to many of your readers for its large yield of gold in former years. During my stay in Helena a large

Fire

occurred, in which one of our contemporaries, the *Herald*, suffered considerable damage, losing \$21,000, with only a small insurance. After the fire I noticed one of Hall's patent safes in the ruins of the *Herald* office which had gone through the fire with its contents, (books and greenbacks,) uninjured. This safe was in one of the hottest fires I ever saw, for about ten hours, and the burglar-proof lock was not damaged in the least, but worked just as well as it did before it was subjected to

the terrible heat. It is now as good as ever, but needs painting. This patent lock was illustrated in the *SCIENTIFIC PRESS* some time since.

Unionville

is about four miles from Helena. Near by are quite a number of good quartz mines, all doing well. The Diamond City Mill has 20 stamps; 2 arrastras and 1 settler. When I was there there were 300 tons of ore at the mill awaiting reduction. The Columbia and National mills are both doing well. The Whitlatch and Philadelphia mills of 15 stamps each were crushing and making profitable returns. There is a general air of prosperity about Unionville and the vicinity of the mills. Many new buildings are being erected and the miners generally are making themselves comfortable. The Columbia and IXL mines both show rich bodies of ore. W. H. M.

### Montana.

We have received from Governor Benj. F. Potts, of Montana Territory, an occasional correspondent of ours, his biennial message to the seventh Legislative Assembly at the session commencing Dec. 4, 1871, from which we make a few extracts, as it gives some idea of the importance of that remote Territory. In the census returns of 1870 the total population is given at 20,580, of which 14,582 were whites. Total value of real estate, \$4,272,766, and personal property, \$11,887,593. Number of acres of land under cultivation, 202,057. The Register at the Land Office at Helena reports that more than 300,000 acres of the public lands have been taken up by actual settlers within the last two years, and the Surveyor General's report shows that 3,324,705 acres of the public lands are now surveyed.

The Northern Pacific Railroad.

The rapid progress made in the building of the Northern Pacific Railroad assures us that it will reach our borders during the coming year. The contract has been let for the construction of the Dakota Division, from the Red River to Missouri, to be completed on the first day of July next. The Great thoroughfare is steadily advancing across the continent, opening up, as it progresses, the finest belt of undeveloped country in America. Every department of this great enterprise is reported to be in the most satisfactory condition, and its complete success, long since anticipated, is now a certainty. The completion of this road through the Territory will add new life and vigor to all our industries, develop our rich agricultural and mining interests, and our population, now at least twenty-five thousand, will be quadrupled in a brief period.

The Mining Interests.

The gold yield of Montana for 1870, was reported at twelve million, and it is estimated that the yield of 1871, will exceed that amount. A large number of rich silver mines have been discovered in the Territory during the past season, and those that have been developed yield satisfactory returns. The present active demand for mining property indicates the richness and substantial character of our mines. If any further legislation be necessary to advance the interests of the mining population of the Territory, you will, I am confident, supply it without any suggestion from me.

RUSSIAN VS. SIBERIAN APPLES.—Dr. C. Andrews, Marengo, Ill., comparing the Russian with the Siberian apples as they have been tested in this country, says: "All the Russian apples have not proved hardy. None but the Oldenburgh has stood the test as far north as St. Paul for any considerable number of years, and some of the most experienced nurserymen of that vicinity do not regard even that as wholly reliable there." On the contrary, he thinks all evidence goes to show the perfect hardiness of the Siberian family. Hundreds of new seedlings of this species are constantly coming into fruit, some of them extreme late keepers, and all accounts report them entirely hardy as far north as they have been tried."

THE SUN-SPOTS.—Prof. Daniel Kirkwood has announced that the period of the sun-spot cycle is gradually lengthening—it being a variable and not a constant figure; and he draws from this fact the conclusion that the cause of this phenomenon is not to be sought in the influence of the planetary bodies, for this influence, being constant, would preclude any variation in its effects; but it must be sought in some purely physical cause operating upon the sun's body.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**TARSHISH.**—*Alpine Miner*, Dec. 9th: Richer than expected was a lot of mundie and zineblende looking ore which came out of the Tarshish mine this week. A lot was assayed which yielded over \$1,500 per ton in gold and silver.

At the Tarshish mill work goes on at a favorable rate. The boiler was set this week, and the work of setting the battery blocks is commenced.

The viaduct for ore from the No. 3 mine of the M. & N. W. Co. will be done to-day.

**SCHENECTADY MILL.**—*Alpine Chronicle*, Dec. 9th: The work on this mill is progressing satisfactorily. The mine continues to show well.

**STOPPED WORK.**—The Exchequer mill has stopped work temporarily. The mine continues to improve and the Co. have any quantity of good ore. It is thought that the Co. will erect a new mill here next spring.

### AMADOR COUNTY.

**RICH ROCK.**—*Amador Dispatch*, Dec. 16th: A lot of remarkably rich rock was struck at the Kennedy mine last Saturday. A large portion of the rock will yield \$150 per ton.

### CALAVERAS COUNTY.

**BIG CLEAN UP.**—*Calaveras Chronicle*, Dec. 16th: A short time since we noticed that the tunnel claim of Paul & Co., near the Junction, was worked out. In the same item we mentioned the fact that it was expected the "tailings" would pay fully as well, if not better, than the gravel did at the first washing. Since then the work of washing the tailings has been commenced with good results. In cleaning up around the old dump-box—less than a week's labor—300 oz. of gold were obtained. At that rate the tailings will prove far more valuable than the original mine, making it one of the very best gravel claims in the county.

**RAILROAD FLAT.**—Parties from S. F. are negotiating for the purchase of the Prussian Hill quartz mine. Some very rich rock has been taken from this mine, and it is believed, if properly developed, it will rank as one of the No. 1 mines in this county. It is located south and east of Glencoe, on the narrow divide between the North and Middle forks of the Calaveras, and west of the great soap stone belt passing through the county.

The French claim, south of Prussian Hill mine, has developed some good rock.

The New Discovery claim, on the upper Calaveras, is going steadily down and good rock coming up.

The Poe mine is idle. The late purchasers will probably lay the mine over until Spring.

The Fifield and Burghart mine is now idle. A large pile of rock on the dumps was sold by the Sheriff and worked in the Randolph mill. Report says it milled \$16 per ton.

The Hard Luck mine, on the South fork, is yielding very rich rock. Some 40 tons are now on the dumps, good judges say, will pay \$100 a ton.

The Big Mine is a steady producing mine. It is between 200 and 300 ft. deep, and still going down and growing richer all the time.

### EL DORADO COUNTY.

**IRON ORE.**—*Placerville Democrat*, Dec. 16th: G. M. Anderson, who lives about one mile and a half north of the lower crossing of Webber creek, on the Coloma road, has hauled during the last 3 months 160 tons of iron ore to Shingle Springs to be shipped to S. F., thence to Baltimore, to be smelted. The yield is from 50 to 60 per cent., and inexhaustible quantities.

### INYO COUNTY.

**GOOD STRIKE.**—*Inyo Independent*, Dec. 9th: An extensive strike of rich ore is reported in the Whittekind, one of the leading mines on the other side of Buena Vista Hill, Cerro Gordo. The Belmont is also taking out more than usual quantities of good rock. In the Jefferson a good body of lead has just been opened, through the Buena Vista tunnel, and from the Omega tunnel about 20 tons of ore are coming from the newly developed cross ledge, daily.

### KERN COUNTY.

**CASTRO MINE.**—*Kern Courier*, Dec. 9th: The Castro mine is equal to any in the county. It is large, easily accessible, and gives strong indication of permanency. Further discoveries will probably be made

in the vicinity or other portions of the skirts of the valley.

### NEVADA COUNTY.

**PROSPERING.**—*Grass Valley Republican*, Dec. 16th: Considerable prospecting for quartz is going on between Deadman Flat and French Ravine, about 3 miles from town. The Independence Co. are running a tunnel for a ledge, which they will reach when they are in 200 ft. They have prospected the ledge on the croppings with satisfactory results. The Constitution Co. a short distance above the Independence, intend commencing a tunnel for their ledge in a few days.

**GREENHORN LEDGE.**—Eighty-two loads of waste rock from the Greenhorn crushed at the Gold Hill mill yielded \$882.

**PERRIN'S MINE.**—Some splendid specimen rock from the Perrin mine was exhibited here on Monday. The mine never looked better than it does now.

**GOOD GRAVEL.**—The Dartmouth Co. are taking out good paying blue gravel from their mine at the foot of School St.

**BANNER MINE** has temporarily suspended extensive operations. The mill was closed down on Saturday. The owners will continue to sink on the main incline shaft 100 ft. below the present level, which is down 620 ft.

The Kelsey Bros. are prospecting a ledge on Deer Mt. near the Banner mine. They are down with their incline about 80 ft., and have taken out 75 or 80 tons of good quartz. They have a 3 ft. ledge, and from a recent crushing of rock realized \$22 a ton.

**LITTLE GREENHORN.**—W. C. Stiles and others are prospecting a ledge on Little Greenhorn, south of Deer Mt. They have obtained excellent prospects and are running a tunnel to strike the ledge at a considerable depth from the surface.

**NEW YORK HILL MINE.**—The water in the mine will all be pumped out by to-morrow night. Miners are at work in the 4th. level taking out rock.

**OMEGA.**—A quartz ledge has recently been discovered near the Fidelity mine, which prospects well. A quantity of the rock was taken to the Fidelity mill, and crushed, yielding \$60 a ton. The mine is considered very valuable, but difficult of access. The owners of the Lindsey ledge, between Fall and Diamond creeks, are running their 10 stamps on \$20 rock. They have a ledge 12 ft. wide, and all the rock pays. The Co. will enlarge their mill next spring, and add ten more stamps. An offer of \$100,000 has been refused for the mine. A new quartz discovery has been made on Jim Dick ravine, which runs into Diamond creek. It is being opened by a S. F. Co. and prospects well. Extensive gravel diggings have also been struck at the head of Diamond creek.

**EUREKA.**—The Erie mine, near Eureka, has been paying well for the last two months. The owners of the Jim mine, near the South Fork, have their main tunnel in 650 ft. and have 350 ft. further to run before they reach the bottom of their incline shaft. Black & Young's mine is paying dividends regularly.

### PLACER COUNTY.

**GOLD HILL.**—*Cor. Auburn Stars and Stripes*, Dec. 14th: The Cement Mill Co. have already started up, having sufficient water for running the ponderous works, and unless the dirt is a cheat, they will continue to pound to a healthy tune.

**EMIGRANT GAP.**—*Cor. Placer Herald*, Dec. 16th: Mining that during last summer seemed so prosperous, was partially abandoned even before the late storm. Want of capital and energy has been the cause.

A quartz discovery was made, last month, 8 miles north of this place. The ledge is purely quartz, and is heavily studded with rich sulphurets, and shows free gold in considerable quantities.

### SAN DIEGO COUNTY.

**BULLION.**—*San Diego Union*, Dec. 7th: Bullion amounting to \$500 was sent by W. F. & Co's Express yesterday.

**AT THE MINES.**—The work on the water power at the Bailey mine is advancing rapidly toward completion. McMechan's mill will commence crushing Redman ore in a day or two. Both mills at Julian are crushing Owens rock, of which there are 130 tons ready.

### SAN BERNARDINO COUNTY.

**DISCOVERY.**—*San Bernardino Guardian*, Dec. 9th: J. Clark speaks very encouragingly of the richness of the McFarland Bros', and Height & Chalfields' claims at Ivanpah.

While in this dist., Mr. Clark spent most of his time prospecting in the range, on the "Snow Storm" side. We have been shown specimens of ore from ledges discovered by him, which equal, if not sur-

passing in richness, any ore yet found in that famous mineral region. Some of this ore—the cropping only—has been assayed at \$157, to the ton. These mines have been located in the name of the "Antonio G. and S. M. Co.," by Clark Lane and Anglesaw, and are directly on the line of the proposed railroad from San Francisco to the Colorado river, and 90 miles from San Bernardino.

**ORE RECEIVED.**—Brunn & Roe received this week for shipment, 3 tons of ore from the McFarland Bros' claim at Ivanpah. This ore assays from \$500 to \$1,300 per ton.

### SIERRA COUNTY.

**HIGH JOINT.**—*Mt. Messenger*, Dec. 9th: The High commission ledge, on the South Fork, owned by the Wehe brothers and Dr. Aiken, is turning out splendid rock. The chimney so far opened, is 30 feet in length and extending into the hill. The ledge is 3 feet in width.

**BALD MT.**—M. Redding, one of the owners of the Bald Mt. claim, at Forest City, informs us that the tunnel is progressing at the rate of 50 ft. per week. They have completed about 1,540 ft., and have 500 ft. further to go, to reach the shaft.

**FITTING UP.**—Mr. Curtis, in charge of the Good Hope mine, is making preparations to fit up the old Wheeler mill. He has purchased a Bodine water wheel only twelve inches in diameter, with which, under a pressure of 40 ft. he will run 8 stamps.

**CHESONVILLE.**—*Cor. same*: The Chaledonians have their underground engine and pumping gear in working order, and are taking out gravel. The Bootjacks are running their main tunnel ahead on a drainage level, preparatory to sinking another incline. Taber & Co., are still running their tunnel, now in bedrock, along the base of a projection of the main cement or volcanic ridge, coursing from Pilot Peak to La Porto, which ridge, a short distance ahead of this work, runs at nearly a right angle with said point and tunnel, so that the tunnel must soon find gravel within this angle, or pierce the main body of cement beyond.

The Union claimants have been able, during most of the season, to wash a small portion of their gravel; it has paid well. The same of the Nevada Co. The No Plus-Ultra front ground up in Whisky diggings, is not paying as well as desired; they, also, are running for that back lead. The Pilot Co. are making good headway. The bonded sale of the North American, Niagara and Vermont Claims, for the English market, still hangs fire. The North Americans, are working 40 hands. They are doing a prosperous business.

### YUBA COUNTY.

**BLAST.**—*Marysville Appeal*, Dec. 12th: A blast of 800 kegs of powder was put off in the Blue Point mine, Sucker Flat, on Saturday last.

## Nevada.

### COPE DISTRICT.

**FINE ORE.**—*Elko Independent*, Dec. 12th: Mr. Low, of Humboldt Wells, presented us with a fine specimen of carbonate ore taken from a ledge at Spruce Mt., which goes about 65 per cent. in lead and 10 per cent. in silver.

**RAILROAD.**—The Last Chance, a lead mine, contains silver with some bunches of fine copper ore and a slight percentage of copper promising some of the strata that compose the lode, which at the depth of 90 ft. is 21 ft. wide. A shaft is sunk on the lode 22 ft. below this, finding the same ore as in the 90-ft. level. It is the intention to run the tunnel on the vein still further to ascertain the length of the chute of pay ore.

The Ella is a copper mine containing mostly a blue carbonate, though now and then we noted black oxide mixed with the carbonate.

In the last 10 days 50 tons have accumulated waiting transportation, and they can now furnish 100 tons per week that will yield from 23 to 30 per cent of copper.

We noticed some rich looking galena ore on the dump of the Hussey tunnel, also on the Sweepstake. Work is still being done on the Humboldt, and Peyton. Campbell & Co. have started a tunnel on the southern side of the mountain near the Lyon mine.

**MOUNTAIN CITY.**—*Cor. same*: The Excelsior and El Dorado mines have proven to be permanent ledges. The Excelsior has been followed some 500 ft., in the tunnel and shows a fine body of mineral the whole distance. They have attained a depth of 150 ft. with the best defined ledge and the best looking specimens I have seen in the dist. The El Dorado seems to be a true fissure vein. The incline is down about 140 ft., and shows a well defined ledge and

the largest body of mineral that I have ever seen in this camp.

There are several mines being worked successfully, among which are the Ku Klux, Monitor and South Star.

The Independent which has been lying idle for some time, will resume operations on the first of the month. The Co. has been engaged in putting up a whim for some time.

Hendy is sinking a shaft on the War Eagle mines near the El Dorado, with a fair prospect of striking a rich chimney of ore.

### EUREKA DISTRICT.

**PHOENIX S. M. Co.**—*Eureka Sentinel*, Dec. 15th: The incline shaft in the Otho measures 95 ft. in depth, which in its downward course, reveals several distinct veins, or strata of ore, varying from 1 to 8 ft. in width, and containing mineral, working from \$60 to \$80 in silver and 40 to 60 per cent. of lead. The vein at the 40 ft. level, has been followed 119 ft. westerly, and 100 ft. easterly, showing splendid bodies of ore pitching north. On the dump we found 250 tons of assorted smelting ores.

The Jenny Lynch is immediately above the Otho, and is supposed to be a continuation of the same vein. It shows a continuous body of mineral from the surface to a depth of 50 ft., at which point a level was started and run a distance of 56 ft. easterly in a vein of ore, varying from 1 to 6 ft. in width. The total depth attained on this shaft is 98 ft., at which point a level has been run 31 ft. easterly on the vein, where a splendid body of ore has been struck, on which work is being vigorously prosecuted.

The vein of ore runs nearly east and west, pitching toward the north at an angle of 32 degrees. The value of the ore taken from here varies from \$50 to \$60 per ton in silver, with 40 to 60 per cent. of lead. There are now 175 tons of assorted ore on the dumps.

The EMPIRE MINE is near the Gen. Lee Con. on Adams Hill, and contains hard milling rock of very high grade. In the shaft is a splendid body of ore showing a width of 4 ft. valued at from \$200 to \$400 per ton in silver, and rich in gold. The average assay value of the ore from this mine has thus far been over \$100 per ton.

The Adams and Farren mine is one of the best properties in this dist. In the early working of this mine, an incline was sunk some 150 ft. in ore all the way, except for a distance of 30 ft. when the work was abandoned, and a perpendicular shaft was commenced. At a depth of 100 ft. a vein of ore was struck, averaging \$60 to \$80 per ton, proving to be of great extent, and, on continuing down from this level to the depth of 200 ft. several veins of ore have been cut, varying in width from 3 to 12 ft. There is one furnace in complete running order, and another is being built which can be put in operation in about ten days.

**LEMON MINE.**—This mine is looking better than ever, showing large bodies of ore.

**LEMON CO'S MILL.**—Notwithstanding the late bad weather, Mr. Crandal has been pushing things ahead with vigor. The mill building is completed and covered. The frame work for the batteries, stamps, pans, etc., is in place, and all things in readiness to receive the machinery.

**THE CONSOLIDATED.**—This Co. is busily at work repairing furnaces etc. The ore piled up now cannot be far short of 1,500 or 2,000 tons, and teams are coming in regularly every day laden with tons more of the same sort.

### ELY DISTRICT.

**MONTHLY SHIPMENT.**—*Ely Record*, Dec. 10th: During Nov. bullion valued at \$419,893.37 was shipped from Pioche.

**BULLION.**—W. F. & Co. shipped since Dec. for Meadow Valley Co. 48 bars, valued at \$52,340.07.

### HUMBOLDT.

**BULLION.**—Unionville, *Silver State*, Dec. 16th: Amount shipped from the Arizona mine, since our last issue, was \$6,003.

**WILL START UP.**—Capt. Page, owner of the Oreana smelting works, and the Montezuma mine, has sent forward a large amount of material, to be used at the smelting works at that place.

**DEEPER AND RICHER.**—At a depth of 100 ft., on the incline at the south end of the Arizona tunnel, the ledge has increased to 4 ft. in size, and is composed of a very fine quality of ore.

**FIRED UP.**—The roasting furnace at the tailings mill of the Arizona Co., was fired up on Thursday, and is in successful operation.

**MINE BONDED.**—Hon. T. Harris, has bonded his mine, in Sacramento Dist., for three months. The mine is looking ex-

2003. *Ch. 910* (400-4000) *Ch. 910* (400-4000)

### The Resources of Montana.

Midway between the Great Lakes and the Pacific Ocean, and embracing the elevated region whence flow, East and West, the head waters of the Missouri and Columbia rivers, and on the extreme northern border of the Union, lies the great territory of Montana, the largest, or one of the largest in the Union—covering three times the area of New York, the Empire State of the East.

A few years ago a small party of daring pioneer miners ventured into this far-off region in quest of the shining dust, which has brought so many thousands to the Pacific slope. Their search was eminently successfully, and others followed so rapidly that the fame of Montana soon became

which is thus opening up in this wonderful region is truly of national importance.

In order to place before our readers more substantial evidence of the productiveness of the soil of Montana, we have caused an engraving to be made of a lot of vegetables which were exhibited at her late Territorial Fair, and which were photographed for this especial purpose. Referring to the engraving:—

In the background is to be seen a fine bunch of celery. The onions on the ground in front of the cabbage are from six to six and a half inches in diameter. To the left may be seen a vegetable oyster. Turnips of very large size will be noticed on the squash and near the melons. Beets weighing from 8 to 10 pounds each can be seen near the melons, and tomatoes lie on the ground beside the onions. A large Chinese cucumber six feet long and 9½ inches

### Photographic Ghosts.

In last week's issue in an article in regard to photographic pictures, observed upon panes of window glass in houses in this city, which occasioned considerable excitement, we gave some facts in relation to the effect of certain gases and exhalations upon glass. Air and light are known to have a marked effect upon glass. Bluish or greenish glasses become by exposure colorless, and other glasses often become purple red from the oxidation of the manganese contained in them. Glass which contains lead suffers another kind of change in the air if sulphuretted hydrogen be present; and the surface of the glass becomes iridescent, exhibiting various colors and often fanciful images.

#### Spiritual Photographs.

In this connection we may call attention

political article in fact. In this case actinic rays had done their work before the glass was exposed to the camera.

By another mode of manipulation, a photographer may produce a ghost-like effect at pleasure; a sitter is allowed to remain in the focus of the camera only half the time necessary to produce a complete photograph; he slips quickly aside, and the furniture immediately behind him is then exposed to the action of the light; as a consequence, a faint or imperfectly developed photograph of the man appears, transparent or translucent, for the furniture is visible apparently through his body or head. With a little tact, a really surprising effect may be produced in this way. As a third variety, one negative may be placed in contact with another, and a particular kind of light allowed to pass through it for a time; there results a double picture on the lower negative.

MONTANA PRODUCTIONS.

world wide. Now about twelve millions of gold are annually taken from her mines; while iron, copper, coal and other minerals exist there in exhaustless abundance.

But it is not in her mines alone that her wealth is to be found. The distance of this territory from the great sources of agricultural productions recently induced a few experimenters to test the capacity of the soil of that region to meet growing wants of its increasing population for bread stuffs, etc. Experiment in this direction was also successful, and it is now believed that there are not less than 50,000 square miles of tillable land within the limits of the territory, which might be made to yield in the greatest abundance all varieties of cereals and root crops. Lands for grazing purposes are also of still greater extent and of the best quality as is fully attested by more than 60,000 cattle which now find pasture upon her thousand hills.

Under these circumstances it is not to be wondered that her population, scattered through sixty-two cities and towns, is increasing in a most rapid ratio, and one which will soon be greatly accelerated by the Northern Pacific Railroad, which will ere long pass through the entire length of the territory. The enterprise

in circumference is on the ground in front of all. The squash was raised by Bass & Bro., and is five feet five inches in circumference, weighing 85 pounds.

The two large cauliflowers in the middle of the picture were raised by E. H. Train, of Helena, and weigh 10 pounds each. The cabbage measured four feet in circumference. The turnips raised by J. M. Stewart, weighed 26 pounds. The potatoes, exhibited by N. Merriman of Jefferson City, averaged from 1½ to 3 pounds each and were from 10 to 12 inches in length. The watermelon, 2½ feet long, and 18 inches in diameter, came from the farm of Bass & Bro. The rutabaga turnips were also of large size. Stalks of rye and a specimen of seven-headed wheat will also be observed, raised by W. T. Mulligan. The corn was raised by Bass & Bro., and some of the Trophy tomatoes, seen upon the ground, by J. V. Stafford; the others by D. W. Curtis. The parsnips and cucumbers shown were very large and of excellent quality as was also the celery, which was raised by Capt. Cadage. Other contributions were made by J. H. Forbes, John Trobner and L. F. Marston. The photograph was taken by E. H. Train.

It is now shown that no inconsiderable part of the increase of gold in commercial channels is the product of the gold mines of Russia.

to the different ways in which secondary images, or as they are sometimes called, "spiritual photographs" are made to appear. We copy from the *London Photographic Journal*:—Photographers are acquainted with three or four different ways in which secondary images may appear in photographs. In the first place, when a sensitive glass plate has served its turn as a negative—as many paper positives as may be needed having been taken from it—the film of collodion or other prepared surface is removed from it, and it may then be used for a wholly new photograph. But it is found that unless great care be used, some faint traces of the former picture still remain, and these may appear as a sort of ghostly attendant upon the figure forming the second picture. One photographer, in endeavoring to utilize an old plate which had fulfilled its duty as a negative, could not wholly erase the image, wash or rub as he might; there was always a faint ghost of the person accompanying any subsequent photograph taken on the same plate. Dr. Phipson relates that a friend of his received at Brussels a box of glass plates, quite new and highly polished, each wrapped in a piece of newspaper; a lady sat for her photograph, taken on one of these plates, and both the photographer and the lady were astonished to see that her likeness was covered with printed characters, easily to be read,—the ghost of a

**IMPROVED DIAMOND DRILL.**—On last Saturday a trial of an improved diamond drill, made by A. J. Severance & Co., was had at the Miner's Foundry, before a number of persons interested in mining, among whom was Mr. Sutro, of the Sutro tunnel, at Virginia City. This kind of drill has heretofore been worked by steam or water power, but the new improvement consists in driving it by means of a force pump. The water was forced through hose with a three-quarter inch nozzle directly upon a small iron wheel known as Lind's Improved High-pressure Water wheel, and the result was, that two 1½-inch drills were driven at the same time through a granite block, at the rate of one inch a minute. The trial was pronounced satisfactory by all present, and it is thought that this drill may be adopted in the Sutro tunnel. The Miners Foundry have already built two of these machines, one for the American Mining Co., at North San Juan, and another for the Union Co., at Columbus Hill. The pump employed at the trial was Knowles' pump, and is said to be very effective for this purpose. The great advantage gained by the use of the force pump is, that the machine may be moved readily to all parts of a tunnel and in various directions, simply by lengthening and shortening the hose.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

The scorification assay is made without any previous roasting. The only reagents used are test lead and dry pulverized borax. The ore is mixed with these and fused in the muffle. I generally use for a charge a quarter of the assay ton, which is 7.291 grammes. If four scorifications are made, the amount of ore treated will be 29.166 grammes, which is the same quantity used in the crucible assay.

In mixing the assay, I use a wooden mustard spoon which holds about eight grammes of test lead. This spoon has a hemispherical cavity of a little less than half an inch in depth, and a level rim. With a strip of window glass or a knife blade the superfluous lead may be struck off, leaving a uniform quantity in the spoon. Previous to commencing scorification, a careful assay of the test lead must be made by cupelling several spoonfuls in separate cupels, accurately weighing the resulting buttons of silver, after which they must be dissolved in acid. If any gold remains, the lead is unfit for use, and it should be removed from the laboratory, lest it should be inadvertently used in the future. All lead contains silver, but should never be used for assaying if four of these spoonfuls contain more than one milligramme, for rich lead is unfit for use, for obvious reasons. Of course, the assay of test lead need only be made once. Knowing the amount of silver contained in one spoonful, and keeping a memorandum of the number of spoonfuls used, it will be easy to make the proper deduction at the time of calculating the final results.

Having weighed out four charges of ore, and transferred them carefully to the same number of scorifiers, four spoonfuls of test lead and one of borax are added to each. A sheet of writing paper is then laid on the mixing table, and the scorifiers placed upon it one by one while being mixed. This precaution is taken to prevent loss by portions being thrown out during stirring.

The mixing is done with a piece of sheet-iron four inches long and half an inch wide, or with a small steel spatula. The scorifiers are then ready for the furnace. Several may be placed in the muffle at once.

A peculiar-shaped tongs is used in handling the scorifiers, which is made by bending a piece of iron or steel double; the lower part terminates in a half ring, which grasps the scorifier, while the upper part is made longer, and extends quite across the top of the scorifier, and holds it tightly when the tongs are pressed together by the hand.

At first the assay is placed in the mouth of the muffle and allowed to heat gradually. When the first action of the heat upon the borax has subsided and beads of lead are seen to form, the scorifier is pushed back to the hottest part of the muffle, and a second one introduced in front. This is repeated until they are all in, or the muffle is full. The door of the muffle is then closed for a time, until the charges have fully fused. The scorifiers are then removed one by one, and while tightly grasped with the tongs, a strong horizontal, rotary motion is imparted to them, causing the slaggy covering to break and attach itself to the sides of the vessel, leaving a circular bare spot on the surface of the molten lead. This effected, they are replaced in the muffle, which is not again closed, but the draft of the furnace must be checked by shutting the lower door, which causes a steady current of air to pass into the muffle, sweeping over the assay and through the small openings, escaping up the flue. Scorification now commences; the borax causes the slag to become liquid. The oxide of lead is seen to form on the surface of the lead bath, moving with a play of colors to the ring of slag, which becomes more and more fluid as the operation progresses. Every particle of gold or silver passes to the lead and becomes alloyed with it.

After a time the slag—from the formation of litharge—becomes so voluminous as to nearly cover the lead. When this is the case, the lower draft is opened, the muffle door closed and the heat raised, to perfect fusion of the assays, which are then withdrawn by the aid of the tongs, and poured out into an iron mould, made expressly for that purpose. When cold, the slag is broken, and the lead button hammered into cubes and cupelled.

Sometimes, but not often, scorification assay work badly, and require more test lead, or more borax. Experience soon

teaches the proper addition to make. In either case, a spoonful is wrapped in paper and placed in the hot scorifier by means of a pair of cupel tongs.

If lead is added, a memorandum to that effect must be made, and the known quantity of silver it contains deducted while calculating results. The computation is the same as that described under the head of crucible assay.

It is sometimes required to determine the amount of free gold in a quantity of poor sulphurets or ore. Ten pounds, carefully sampled, is washed down in a pan or evaporating dish to a small compass, which is dried and transferred to a scorifier and treated, as described before. Care must be taken to dry without loss, and to crush every particle from the pan into the scorifier, while placed on a clean sheet of paper.

Very good results are obtained in this way. The only difficulty is the calculation of results with the ordinary weights used in the assay office. The easiest method is to weigh the gold in decimals of a gramme, and to multiply this by 200, which gives the number of grammes of gold in a ton. This amount is multiplied by the value of a gramme of gold, which has already been given.

In this case, as well as in that of the ordinary scorification, as first described, it will be necessary to melt the cupelled button with silver, and to boil in nitric acid, to obtain pure gold.

This scorification assay, which is equally well adapted for assay of rock containing gold, as for sulphurets, will be found easy to manage, and very correct in its results.

## Roman &amp; Co.'s New Store.

Roman & Co. have moved their large stock of books and their entire publishing business up town, into the Lick House block. Their new quarters are excellent. The shelving on either side is finished in our beautiful white cedar, which so closely resembles the laurel that it might be appropriately classed as its twin.

At the left of the main entrance, enclosed in glass cases reaching up to the handsome cedar cornice, is the department of sacred volumes and belles-lettres. Many of these books are in expensive morocco bindings. At the right, in glass cases also, is the select circle of the poets. Beautiful show cases occupy the middle space filled with an assortment of choice and handsome writing utensils, viz: paper weights, paper cutters, ink stands, rules, etc., etc.—the most elegant display in the city.

Roman & Co., are the agents of the American Sunday School Union, and their publications fill a large department in the new store.

In the center of the store is the office, neatly finished in paneled cedar about three feet from the floor, and surrounded with frosted panes glass, framed in light cedar mouldings. The clerks in this department have a full view of the store in either direction.

At the extreme end is the wholesale department with its desks, subscription office and sample tables. Among some of the specialties kept for sale at this popular house, we noticed particularly the initial stationery and monogram examples, the Bibles and prayer-books, and juvenile books.

Roman & Co., have published many of our California works, and have held out every inducement to authors that their facilities afforded them. They were the first publishers of the *Overland Monthly*—the first to bring out a sample of juvenile literature in the publication of the "Golden Gate Series."

We are happy to find them thus enlarging their facilities for business, and that they have opened such an elegant and handsomely appointed house.

The Acclimatizing Society held a meeting on Saturday evening, and appointed a committee to prepare a game law for the consideration of the Legislature. The law is intended for the protection of native and imported game from destruction by reckless "pot hunters."

The Society has had complete success in its acclimatizing experiments with trout, and will this winter introduce the black bass and several varieties of game birds into the State. Several thousand dollars have been expended in arranging the ponds and hatching houses, at the San Pablo ranch, fifteen miles from this city, and the enterprise never had a more promising outlook than at present.

The wine crop of Santa Cruz County will this year exceed 25,000 gallons.

## USEFUL INFORMATION.

SCIENCE PERFECTING SWIMMING.—Fred-eric Barnett, of Paris, has invented and patented a very novel yet simple apparatus for swimmers. The invention consists in supplying to man by art the apparatus which has been given to the frog by nature. For the hands he has a large membranous fin which is held to its place by loops passing over the fingers and a strap around the wrist. The surface presented to the water by these fins is so large as to add greatly to the effectiveness of the strokes of the arm, but not so large as to exhaust the muscular power. Their effect is to very much reduce the effort required to swim without them. But the greatest ingenuity is displayed in the form and fitness of the fins for the legs, which are attached to the ankles, and are so formed that they act upon the water, both in the movement of bringing the legs together and throwing them back. They act so finely in treading water, as swimmers call it, that one can really walk, if not on the water, at least in it. The difference between swimming with this apparatus and without it, is very much like the difference between rowing a boat with a handle and the blade of an oar. The old swimmer has no trouble in using the fins at first trial, and is surprised to find with what strength he can swim without exhaustion. He easily swims twice as fast with the apparatus as without it, and he can sustain himself for hours upon the water, or swim miles with it.

SOLIDIFYING AND MELTING POINTS OF FATS.—Dr. Wimmel, in *Poggendorff Ann.*, directs attention to the fact that many fats may be made to solidify at two different temperatures. Those fats which yield glycerine by saponification especially show this peculiarity; the temperature at which solidification occurs being lower than that at which melting takes place. When these fats, after melting, are allowed to cool, their temperature gradually falls to a certain point, where for a time it remains stationary, and then exhibits a certain rise as it becomes solid. The definite degree of heat at which this takes place, Dr. Wimmel proposes to call the natural point of solidification, as this point is less changeable than the melting point—a characteristic the direct opposite of that attending the change of water into ice. The fact that ice is formed at different temperatures has led to the adoption of the melting point of ice as a fixed point from which to measure degrees of heat.

CURIOUS EXPERIMENT.—Mr. Kroeger points out the following mode of determining which of two objects seen from a distance is further off than the other. Let the reader suppose two trees, for instance, standing in a line with the eye; if he moves his eye to the right, the tree which is nearer will appear to move to the left, and the other will seem to follow the motion of the eye. The experiment is curious, and may be easily performed, only taking care to make the eye move in a line perpendicular to that in which it previously was; that is perpendicular to the line which joins the two objects; then the object which follows the motion of the eye is the further of the two.

TO EXAMINE THE INTERIOR OF A CHIMNEY.—It often becomes desirable to examine the interior of a chimney. With the view of observing what may cause the annoyance of smoking. An exchange suggests that for such purpose a piece of looking-glass may be held in an aperture, for a pipe in the chimney wall at a proper angle. If the observer can see the light of the sky, he will also see the whole interior of the chimney, and any obstruction in the same. As most chimneys are straight and perpendicular, reflection will make the top opening clearly visible. Defects which may render danger from fire imminent may sometimes be thus observed and guarded against.

ANOTHER INTERESTING EXPERIMENT.—Take three bowls; pour into one cold water, into another hot water, into the third water that is neither cold nor hot; then place each hand respectively into the hot and cold, and now thrust both into the lukewarm. The hand that was first put into the cold water, will feel hot; and that which was in the hot water will feel cold, although both are exposed to exactly the same temperature. This simple experiment proves that the sensation of heat or cold is, to a great degree, relative, and teaches the lesson that to secure comfort, in extreme climate, we must neither warm ourselves too much in winter, nor cool ourselves too much in summer.

## GOOD HEALTH.

## The Pulse.

The number of contractions of the heart, measured by the pulse in any of the arteries, is liable to considerable variation within the limits of health, depending on differences of age, sex, muscular exertion, mental condition, state of digestion, and period of the day. As a general rule, the healthy human heart beats as follows, in the respective ages: at birth, about 100 times in a minute; during the first year, about 120; second year 110; third, 100; seventh, about 90; fifteenth about 80; during adult life, 70; in old age, 50 to 70. If the average of the adult male be set down as 70, that of the female will be about 80; in acute disease, the pulse often runs up to 140, and over; in chronic affection of the brain and heart, and under the influence of digitalis, and similar drugs, it may descend to 40 and even 20 per minute. Muscular exertion raises the pulse, the sitting posture, which requires considerable muscular action, increases it about 5 beats per minute above that of the recumbent position; the difference between standing and sitting is about 10 beats per minute. We have a practical proof of this in the phenomena of ordinary fainting; when the heart fails in the sitting posture, the person faints and falls, the less amount of muscular action required in the latter position enables the heart to recover its power, and the person returns to consciousness; nature, in such cases, puts an individual in the horizontal position, which, in itself, is generally sufficient for his restoration. From this we learn, therefore, that when any one feels faint, let him at once lie down, instead of fanning, and slapping, and wetting him in a seated posture. The great difference resulting from posture is also often seen in convalescence, in which an invalid, very comfortable when in bed, faints, and may even die, on assuming the sitting position. In bleeding a person, it is customary to have him sitting up, in order that the resulting faintness may be relieved by lying down; faintness thus produced in a horizontal posture might not easily be recovered from.

Mental excitement and the digestive process increase the frequency of the pulse.

## A Few Facts About Homeopathy.

Homeopathy having become quite a successful system of medical practice, we have thought it might be interesting to many of our readers, to note the following facts, which we gather from a late authentic report:—"Seventy years ago Hahnemann planted the small but vigorous shoot, and now behold its roots spreading into all countries. It is naturalized in Austria, Switzerland, Prussia, France, Italy, Russia, Germany, Spain, Brazil, America. In New York alone upwards of 400 qualified practitioners dispense it; in France, about 300.

In England, several hundred medical men openly practice Homeopathically, and the number is daily increasing. These medical practitioners and their lay supporters promulgate their principles through quarterly and monthly journals. There are also six Homeopathic Medical Societies for scientific discussion; four hospitals; seventy dispensaries for the treatment of the poor—a very large amount of public and gratuitous work, when we consider that it has to be carried on by about three hundred practitioners.

In the United States of America there are nearly 5,000 Homeopathic physicians; six colleges, several hospitals, and one or more free dispensaries in each of the large cities.

San Francisco has its share of Homeopathic physicians all of whom have good practice and as a body of professional men, rank high in the estimation and confidence of the people. The Homeopathic Pharmacy, on Sutter street, is a creditable institution, and is conducted on the plan of all the Pharmacies in the United States. The attending clerks are regularly educated for this branch of the business—if any one is desirous of gaining information upon Homeopathic subjects, they can call at the Pharmacy and find every advantage in the way of books, and communicative clerks to assist them. That the system has its favorable points to commend itself to the scientific mind and the sufferings of humanity, there is no doubt—that it has been attended with general success is an acknowledged fact. While Homeopathy is not an agricultural subject, we are ready to give every branch of interest and industry such attention as our columns will admit.

## Science Again Triumphant.

The Signal Service Department at Washington, telegraphed to this city on Saturday evening last, that a severe storm of wind and rain might be looked for on the Pacific coast the next day. Sunday dawned as had many other days just preceding, and few gave heed to the warning; but Sunday evening came, and with it rain-clouds and high winds and symptoms of an approaching storm, which as the night wore away, increased to a terrific gale which continued throughout the succeeding 48 hours—thus fully verifying the predictions of the signal officers, two or three thousand miles away. We have here another striking illustration of the progress made in meteorological science, during the few years past. The farmers and miners of the Pacific Coast have been both surprised and delighted with the result, and are ready to note the highest note of praise, if not something more substantial, to the "weather-wise" solons at the national capital. This remarkable instance of premonition, although the first successfully given on this coast, should be received as a hint that our people should take some active steps to utilize this important government service. Such premonitions might be made useful in other ways than directing farmers when to look for rain and mariners when to make provision for "heavy weather." In the Eastern States where the benefits of this system have been more marked, the observations are utilized for the public benefit by causing outline maps of manifold paper to be placed in hotels, telegraph offices and other public places, every few hours, wherein the courses of storms, even at distant points, are traced and exposed to public view. Why might not this arrangement be carried out in San Francisco.

## Additional Mining Legislation.

Defects in the Law of July 26th, 1866.

We learn, by private advices from our Washington correspondent, that the forthcoming Report of the Commissioner of the General Land Office will recommend some additional legislation upon the matter of adverse mining claims which often arise under the 6th section of the mining act of July 26, 1866, which provides:—

That whenever any adverse claimants to any mine located and claimed as aforesaid, shall appear before the approval of the survey as provided in the 3d section of this act, all proceedings shall be stayed until final settlement and adjudication in the courts of competent jurisdiction of the rights of possession to such claim, when a patent may issue, as in other cases.

The act is entirely silent as to the time within which, or the party by whom, the action shall be commenced in court for the determination of the question of right of possession; and in consequence the Land Office encounters much difficulty in reaching definitive action in cases, which frequently occur where neither the applicant for patent nor the adverse claimant is willing to take the initiative in judicial proceedings.

In the earlier cases of this kind it was ruled that upon the party out of possession should rest the onus, and that he should commence suit within a reasonable time after notice, or his claim should be considered waived; but a difficulty arose in enforcing this rule in this, that possession of mining property is frequently more constructive than actual; that both parties may have the constructive possession, but neither be in the actual possession; again, both parties may be in actual possession of and working the same lode, but at different points and under different locations and names, it not being known until development that the veins were one and the same. In such cases, both parties being in possession, the foregoing rule would of course be inapplicable.

The general rule now adopted by the office is that the adverse claimant shall institute the required proceedings in court, and that his failure to do so within a reasonable time, after due notice, shall be considered as a waiver of his claim; this ruling, however, being varied where, under the circumstances, its enforcement would work a manifest injustice to the adverse claimant; such cases, however, being exceptional.

### Another Source of Difficulty

exists in the fact that the diagram and notice required by law to be posted upon the claim for ninety days before survey are found insufficient to give proper information of the precise, or even the approximate area and boundaries of the surface ground claimed for the convenient working of the mine; adjoining claimants being consequently unable to determine, until the final survey is actually made, whether the claim for which patent is sought conflicts with their rights or not, and when they find that such conflict actually exists, their objections are frequently presented too late for consideration, as the law limits the filing of adverse claims to the date of the approval of the survey by the Surveyor-General.

It is suggested as a remedy for this evil that where an application is made for a patent for either a lode or placer claim requiring survey, the applicant should be required by law to first cause a survey to be made of the ground so claimed, in the proper manner, by a United States deputy surveyor; that the notice and diagram be made from this survey, giving its proper metes and bounds; that thereafter said diagram and notice be posted and published according to law for the period of ninety days, and at the expiration of that time, should no adverse claimant have appeared, the Surveyor-General will approve the survey so made in the customary manner.

The Commissioner thinks no reasonable objections could be offered by bona fide claimants to the adoption of the plan suggested; that the survey will certainly cost the applicant no more if made before than after the expiration of the ninety days; and adjoining or adverse claimants will then have the opportunity of knowing, from the corner posts of the survey, as well as from the notice and diagram, precisely what ground is claimed by the ap-

plicant for patent, thus enabling them, should a conflict exist, to set forth in their adverse filings the exact extent and nature of the conflict.

We have also been placed in possession of some facts, which we believe have not hitherto been published, with regard to instructions which have been issued in the matter of mining claims; the segregation of agricultural from mineral lands, and the present status of mining claims in school sections; all, or a portion of which we shall publish next week.

## Swamp and Overflowed Lands.

Important Decision by the Secretary of the Interior.

Our Washington correspondent under date of December 9th sends the following:

The Secretary of the interior in reply to certain questions propounded by the Commissioner of the General Land Office, in his letter of the 16th of August last, in the matter of the construction of the Act of Congress, of July 23d, 1866, "to quiet land titles in California," so far as the same relates to swamp lands, has, after careful review, rendered a decision in substance as follows:

1st. That the first three sections of the Act relate to lands which have been disposed of by the State to purchasers in good faith under her laws, and confirm to the State all such selections, except in the cases named in the proviso to the first section.

2d. That the fourth section secures to the State, as swamp and overflowed, all lands that are represented as swamp on the approved plats of U. S. Surveys that had been made prior to July 23d, 1866, or that should thereafter be made, and required all such lands to be certified over to the State in all cases where no adverse claim existed.

The U. S. Surveyor-General shall examine the State Segregation maps, in townships which had been surveyed by the U. S., prior to the date of the Act, to conform to the U. S. rectangular system, he shall construct and approve township plats accordingly.

That in all townships where the State surveys do not conform to the rectangular system, and in all townships which had not been surveyed by the U. S., prior to July 23d, 1866, the Surveyor-General is required to make segregation surveys of swamp lands, upon application, made to him by the Governor of that State and within one year from such application, and to report the same to the General Land Office; that in making these surveys he is to be governed by the best evidence he can obtain, and the State, if not satisfied with them, has the right to introduce testimony before the Surveyor-General and to appeal from his decision to the Commissioner of the General Land Office.

That the Surveyor-General, in the examination of segregation maps conforming to the rectangular system in townships which had been surveyed by the U. S., prior to July 23d, 1866, and to which there was no adverse claim, should not under the law take into consideration the quality of the land embraced in such segregation surveys, but should treat them as swamp, whether they were so in fact or not.

HIGH COMMISSION MINE.—Mr F. P. Wehe has shown us some very fine specimens of "free gold" ore from the High Commission mine near Downieville, Sierra, Co. The average width of the ledge is 3 feet. It was found from a "stringer" dipping north, about 200 feet below the ledge proper and on further prospecting the main ledge was found on which a shaft 30 feet deep has been sunk. A tunnel is now being run to strike the ledge at a considerable depth. There are now on the dump some 30 or 40 tons of ore that will average about \$40 and a number of sacks of specimens have been put away for safe keeping. The ore is very good and the mine looks well and promising. The owners are Dr. Aiken, Wehe Bros. and Mr. Barton.

# POPULAR LECTURES.

## THE CHEMICAL AGE.

[By Prof. EZRA S. CARR, of the Cal. State University, before the MECHANICAL ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

LECTURE 2. DEC. 16.—Professor Carr, after announcing that there would be no lecture next Saturday evening, said that the present one would deal mainly with the "Chemical Age, or the First Chapter in the Earth's History." He said that Geology was the Earth's History, written by itself on the rocky strata, in the nature and character of the elements and in its physical features, so plain that "he who runs may read." History is but development, and development implies plan—mind and intelligence. To the true scientist, matter is but the manifestation of His spirit, the expression of the Divine will and the laws of Nature but the modes of the Creator's operation. Let us look at this open language of the Creator, let us read some portion of this in the light of chemical knowledge and learn the first chapter in the earth's history. Shakspeare divides the life of man into seven ages, let us divide that of the world into the same number: 1st.—The chemical age; 2d.—The Age of Mollusks; 3d., of Fishes; 4th, of Coal Plants; 5th, of Reptiles; 6th, of Mammals; the 7th culminating in the Age of Man. Chemists have determined that the entire world, including the air, water, and all solid minerals are composed of 65 forms of matter. The professor, by the use of the blackboard, enumerated the 65 elements comprising the earth, and gave their relative proportions. He repeated some of the experiments of the last lecture in connection with the properties of oxygen.

So far as the world is concerned, to interpret it aright, we must know the elements of its parts. The elements were created before the compounds could be made and when they were first brought into existence and became combined in different proportions, the action must have been very wonderful. From a few simple experiments with the different substances which have an affinity for oxygen, we can form some idea of what the first act of creation must have been. As oxygen has already been considered we will now take up

### Silicon.

This substance, in combination with oxygen forms silicic acid, or, in other words, quartz, which exists abundantly in Nature. Silicon is a dark brown body never found in Nature uncombined, having a strong affinity to oxygen. In combination with other substances it forms about one-quarter of all the solid material of the earth. Heated in oxygen or air it burns, forming silica.

### Aluminum.

A light body not easily melted, having a metallic luster, and burns, when heated in the air, with a bright light, forming alumina. Very abundant in Nature. This metal alloyed with copper, forms a valuable compound very nearly resembling gold and used in the manufacture of jewelry, etc. The compound called bell metal resulting from this alloy contains 10 per cent. aluminum and 90 per cent. copper.

### Magnesium

is a white metal, malleable and brilliant. It fuses at a red heat. Does not exist uncombined with other substances. By burning it in the air it emits a brilliant light showing how readily it unites with oxygen. Potassium, Iron, Sodium and Carbon all combine readily with oxygen.

### Potassium

has to be kept in vessels free from oxygen such is its strong affinity for that element. It is soft like putty and readily tarnishes. When exposed to the air it is gradually converted into a white brittle substance called potash. When heated in air it burns with a violet-colored flame. It floats on water which it decomposes by taking away the oxygen to form oxyd of potassium, liberating the hydrogen which burns with a portion of the metal, as you see by this experiment.

### Carbon.

Oxygen unites with carbon at a red heat and also when exposed to the air. In the process of burning it combines with oxygen and forms carbonic acid gas. This gas is heavier than air except when in a heated state. I have in this bottle a little carbonate of lime or common marble. By bringing it in contact with hydrochloric acid, (any acid would do as well) car-

bonic acid gas is eliminated. Being  $1\frac{1}{2}$  times heavier than air it does not support combustion. By dipping out some of this gas in this little glass bucket and pouring the invisible substance on a lighted taper it is extinguished, as you see.

#### Hydrogen.

I have in this vessel some zinc and water. By pouring in some sulphuric acid, the hydrogen is set free by the consequent decomposition of the water. No heat is required in this operation, as you see. I prove the existence of hydrogen by lighting the gas at the end of the tube. These soap-bubbles, by rising, show that it is lighter than air. It is explosive, as you may see by holding the taper to the mouth of this inverted jar of hydrogen. It is a combustible body. The union of this body with oxygen, in the proper proportions, forms water. If we decompose water, we will have as a result twice as much hydrogen as oxygen. It is explosive when brought suddenly in contact with the air and heat. This I demonstrate by putting some of the gas in this basin and making hydrogen bubbles, which, as you see, explode with a loud noise.

#### Phosphorus.

Artificial heat in these experiments is not always necessary. I have here a solution of bisulphide of carbon and phosphorus. On the evaporation of the bisulphide of carbon, the phosphorus ignites the paper.

#### Chlorine

is generally found in combination with sodium in the form of common salt. I put this piece of antimony into the jar of chlorine, and it burns violently without the necessity of heat. There are certain elements which unite without an elevated temperature. The Professor illustrated some of the bleaching properties of the element by bleaching the color out of a piece of cloth, and the black from a vial of ink. With hydrogen it forms hydrochloric acid.

#### Sodium

has to be kept from the air. If unites with chlorine to make salt. This vapor in the bottle, the result of the burning of the sodium in the chlorine, is common salt.

Thus we have seen that the great mass of the earth consists of oxygen compounds; that the rapid union of oxygen with other elements constitutes combustion; that water is the burned product of hydrogen, magnesia of magnesium, lime of calcium, alumina of aluminum, silica of silicon, carbonic acid of carbon, and phosphoric acid of phosphorus. In most of these experiments, a certain amount of heat was necessary to start the combustion. But we have also seen that in some cases where the substance was minutely divided, union took place at ordinary temperatures, and that in all the experiments, light and heat were produced in proportion to the intensity of the action. If we now assume that the elements were created before their compounds (which is equivalent to assuming that the sand and clay existed before the bricks in these walls were made), endowed with their well-known properties and projected into space in their atomic condition, a condition most favorable for chemical action—you will at once see in the light of these experiments the inevitable result.

The attraction of gravitation would draw the atoms together; chemical affinity would combine them, and we would have a conflagration compared with those of this lecture, as the few grains of matter I have used compare with the mass of the globe.

From the heat thus produced, our Earth would be a vast aeriform body, a blazing luminous star, in which condition we will leave it for the evening.

#### A Novel Publication.

We were shown a few days since a new idea in the way of advertising, consisting of a book, handsomely bound in blue and gold, containing about 100 pages of interesting matter comprising tales, sketches, poetry, witticisms, etc., chiefly by California authors. The remaining 200 pages are devoted to descriptions of the business of those who subscribe for the work, making it a sort of directory of the Pacific Coast; containing a few of the principal houses in each branch of business in the leading towns of California, Oregon, and Nevada.

The names of the towns appear in alphabetical order as do also the kinds of business in each town. The names of the firms are arranged in the same way, enabling one to see at a glance who are the principal dry goods dealers, photographers, jewelers, manufacturers, etc., in any place on the coast.

The books are to be given away by the parties who have descriptions of their business in them. By paying \$50 for one page, 40 books are received to be distributed as the advertiser chooses. So every page thus disposed of will represent 40 copies in circulation.

The advertisements are to be descriptive of the business, in order to be made readable, and nothing in the nature of an ordinary advertisement will be inserted in the body of the work. It is compiled and published by Price & Haley.

#### The Dollar Steam Engine.

Our illustration represents a simple piece of mechanism, in small compass, called the "Dollar Engine." It is made more for boys who have a mechanical taste, than for any other purpose. It is a single cylinder oscillating engine; the cylinder takes steam at both ends. A safety spring acts as a safety valve, which renders explosion impossible. The boilers have copper bottoms. The stand is movable, so that the engine may be run by removing the stand and placing the boiler upon any heating surface.

The engine will run  $1\frac{1}{4}$  hours with a flame at ordinary light. The boiler has a steam dome and concave bottom, the latter giving large heating surface and consequently an abundant supply of steam which insures great speed and power. The bottom of the lamp is turned up so

Martin, and by a regular chain of assignments conveyed to the plaintiffs. A complaint in equity, alleging the same facts and for the same purpose, has been filed against David Thornb, George G. Allen and Thos. Watson.—*Bulletin*.

#### Our Home Industries.

##### San Francisco Glass Works.

This establishment is located at foot of Fourth street, Newman & Duval proprietors. During a recent visit we found them busily engaged in making demijohns, earthenware, wine, and mineral bottles, etc., which seemed fully equal to the imported articles. About thirty men and boys are employed, and arrangements are being perfected to manufacture patent fruit jars for the coming season. We learn that none but the very best jars will be introduced. Acid bottles with glass stoppers are also made, a new thing

THE DOLLAR STEAM ENGINE.

as to form a saucer or rim, for the purpose of preventing any fluid spilled in filling the lamp, from igniting and burning the table or stand on which it is placed. Mechanical attachments suitable for these toy engines are made to go with them, such as sawmills, triphammers, etc., and will be found instructive and amusing for the young. For further particulars address, Wiester & Co., No. 17 New Montgomery street, in this city, or Kraft & Huffington, manufacturers, Brooklyn, N. Y.

**INFRINGEMENT OF PATENT.**—In the U. S. Circuit Court, R. R. and Joseph Craig have brought a suit in equity against Frank H. Fisher, for alleged violation of a patent. The patent consists of an improvement in a hose nozzle, which provides the discharge pipe or nozzle with radial plates, which are constructed so as to run lengthwise with the discharge pipe, and to extend sidewise from the outside of the orifice in the pipe towards the center of the same. The object of, and the result accomplished by, the invention is to cause the stream of water which passes through the pipe to leave the same in a straight line, and without any twist or rotary movement in it; the water does not scatter as it leaves the pipe, but is ejected in a straight, concentrated stream, and on this account is much more effective in hydraulic mining. This improvement it is claimed, was invented and patented by Chas. F. Macy and Seth

in California. These glass works from their accessible location, attract many visitors to see the process of glass blowing. A large assortment of goods is kept constantly on hand, and private moulds (lettered) for furnishing bottles to those who put up special articles or wish to have their names engraved upon them. The proprietors received a silver medal at the late Mechanics Institute Fair, for an exhibition of fine glass ware. They propose at no distant day enlarging their establishment and manufacturing a better variety of glass. The whole works are under the efficient management of Mr. C. Newman.

**TESTIMONIAL TO A MINING SUPERINTENDENT.**—A magnificent dinner set of ninety pieces, made of solid silver, was presented to Charles Forman, on Sunday, by Lafayette Maynard, President of the Meadow Valley Mining Company. The set was expressly manufactured by Geo. C. Shreve & Co., jewelers, of this city, for the Company in whose behalf the presentation was made. The pieces bear the following inscription: "Testimonial from Meadow Valley Mining Co., to Chas. Forman, late Superintendent; December, 1871."

Business having compelled Mr. Forman to resign his position as Superintendent, this testimonial has been made and a set of resolutions complimentary to him, passed by the Company.

#### The Scientific Press for 1872 Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXIV.

The weekly issues of the Press will contain reliable

#### Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

#### For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

#### Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

#### For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and nature and progressive intellects of both men and women.

#### Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professional, scientific men," but rather a

#### Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

#### The New and Novel Developments

In the progress of this comparatively new section of the Union, but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe, enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untrodden field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experience often save costly experiments and disastrous results.

#### Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. On paper presents

#### A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Our community is not so numerous or our field so thickly settled as the Eastern States and Europe, consequently we wish each friend of our enterprise to bear in mind the greater importance of his individual patronage, and also the value of

#### Speaking a Good Word

For the Scientific Press to those who are not, by personal acquaintance, familiar with its more than ordinary value and merits.

No intelligent reader will regret sending his subscription without delay. A trial is not expensive.

Subscriptions, payable in advance—\$4 per annum. Single copies, post-paid, 10 cents. Address

#### DEWEY & CO.,

Publishers, Patent Agents, and Engravers, No. 338 Montgomery St., S. E. Corner California, S. F.

**NEW PUBLICATIONS.**—We have received advance sheets of R. W. Raymond's *Mineral Resources of the Pacific States and Territories*, for 1871, which we shall notice next week.

DOMESTIC ECONOMY.

Tools for the Women.

A year or two since the writer had a circular stairway erected in her front hall by a professional stair-builder. The tool chest of that workman was to her a curiosity shop. What delicate gouges were there, what polished chisels, what fine-toothed saws, what fancy planes! Whenever that artisan had a nice piece of fitting to do, out of the recesses of that chest came just the tool for the occasion.

Now, a housekeeper operates in cloth, and meat, and flour as materials, just as a carpenter works in walnut, and pine, and white wood. She needs the most appropriate tools, and she cannot do good work without them. Why are not women as well supplied with implements for performing their various tasks as are workers in stoue, and wood, and iron.

Before the American Institute Fair came to a close we went from end to end of that great building, with note-book and pencil, setting down ever invention that promises relief to women. Many of these are simple conveniences. For instance, there is a clothes-line holder that will fasten a line of any size, filled with clothes of any weight, in wind of any force, without knotting, tying, or untying. There is a sliding-gauge button-hole cutter instantly set to cut any size required. There are castors for sewing-machines which allow the machine to stand firmly when in use, yet permit it to move about when desired with the greatest ease. There is the automatic bobbin-winder for shuttle-machines, which will wind the bobbin with the uniformity of spool-cotton while one is sewing.

For invalids we noted two or three valuable conveniences. Foremost among these is the earth-closet. There is a folding-bed and settee combined, always ready for use. There is a stuffed chair with iron frame that can be put in a great variety of positions, with foot-rests and arms. A chair and step-ladder combined makes a valuable addition to our library and kitchen furniture. The mica lamp-chimney is a desideratum longed for by housekeepers; it does not break by expansion or contraction from heat or cold, and is easily cleaned. The combination brush and mop-holder by unscrewing a little clamp, may be converted into broom, mop, brush, scrubber and pope's-head.

There is a mode of fastening window-shades without springs, pulley-brackets, or racks. There is a baby-jumper mothers will find convenient for young children, and combination toy-blocks invaluable for those of larger size. There is a lightning chopper that makes play of preparing mince-meat and sausages. There is a reversible griddle that cannot fail to produce batter-cakes perfect in shape and defy the most awkward Bridget to make them ragged in turning. There are washers and wringers that reduce the labor of cleansing clothes one-half or two-thirds, according to the skill of the operator in using them. Let husbands who love their wives remember them with a gift of some one of these conveniences when Santa Claus makes his Christmas call down our stove-pipes and through our register.

MORE ABOUT APPLES FOR HUMAN FOOD. With us the value of the apple, as an article of food, is far underrated. Besides containing a large amount of sugar, mucilage and other nutritive matter, apples contain vegetable acids, aromatic qualities, etc., which act powerfully in the capacity of refrigerants, tonics and antiseptics; and when freely used at the season of mellow ripeness, they prevent debility, indigestion, and avert, without doubt, many of the "ills which flesh is heir to." The operators of Cornwall, England, consider ripe apples nearly as nourishing as bread, and far more so than potatoes. In the year of 1801—which was a year of much scarcity—apples, instead of being converted into cider, were sold to the poor, and the laborers asserted that they could "stand their work" on baked apples without meat; whereas a potato diet required either meat or some other substantial nutriment. The French and Germans use apples extensively, as do the inhabitants of all European nations. The laborers depend upon them as an article of food, and frequently make a dinner of sliced apples and bread. There is no fruit cooked in as many different ways in our country as apples; nor is there any fruit whose value, as an article of nutriment, is as great, and so little appreciated.—*Water-Cure Journal*.

Riddance of Cats Without Killing Them.

In cities and villages nearly everybody has trouble with cats. They catch more chickens than rats, rob bird's nests and kill the birds, scratch up the flower beds and run through the vines, besides crying murder all night to the great annoyance of the people. Many families have pet cats, and it is not clever to kill them although they are a great nuisance. A friend of ours has invented a way to get rid of these pests which may be of use for some of our readers to know. Take a large box, open on the bottom, and put slats on the top so that you can see the fun after the performance commences. Set a figure four (trigger—4) baited with meat under one end of the box at the place where the cats frequent. When you catch one, light a pack of fire crackers and put them through the slats into the box with the cat; and if you want to see some grand lofty tumbling look in. Raise the box and let the cat go before all the crackers have exploded. And if you want to keep the time that cat makes have your watch in your hand and look quick; about all that you can see is the very large tail they will have as they leave, flying. One application for each cat, or for each batch, if you care to keep them until you have several, will be sufficient for the season, and the neighbors will not be troubled with their cats running away from home for quite a while.—*New Albany Ledger*.

Corn Husk Baskets.

The materials are pasteboard, corn husks and silk or flannel of some high color. Cut out the sides six inches at the top, five at the bottom and one and a half wide; cut two more for the ends, four inches at the top, three inches at the bottom and one and a half wide; cut out the bottom five by three inches; cut a strip three-fourths of an inch wide and nine long for a handle. Then cut the lining of silk or some material not attractive to moths. The bottom and sides may be cut in one piece, care being taken to allow for seams at the ends and corners and also at the top to turn down under the husks on the outside. The end pieces must be cut separately and joined to the other. Sew all the pieces of pasteboard together, letting the handle have three quarters of an inch hold. Cut pieces of corn husk three-eighths of an inch wide and one and three quarters of an inch long; cross the ends; sew firmly to the pasteboard (beginning at the top) so as to make the points thus formed stand outward. When the whole is covered, fasten the lining by tacking here and there with silk of the same color. This makes a pretty note or card receiver for the center table.

MAKING STARCH.—The following is said to be a good receipt for making good, cheap and lustrous starch. It is prepared as follows: Into six pounds of cold water one pound of the best quality of wheat flour is stirred, when well mixed one ounce of aqua ammonia is added, while the mass is at the same time kept in motion. The flour swells considerably, and assumes a pale yellow color. Five pounds of cold water are then added, and the whole heated and boiled together for a quarter of an hour, by which means the surplus of ammonia is expelled. The paste thus obtained is semi-transparent, and fit for use. It gives a fine gloss not only to woven fabrics, but to paper, etc. It is very serviceable for purposes of the laundry, since it stiffens well, and quickly produces the desired gloss.

BAKED POTATOES.—Potatoes are more nutritious baked than they are cooked in any other manner; and they relish better with those who have not been accustomed to eat them without seasoning. Wash them as quickly as possible without burning in the least. As soon as they are done, press each potato in a cloth so as to crack the skin and allow the steam to escape. If this is omitted, the best potatoes will not be mealy. They should be brought immediately to the table, as they will soon become solid and lose their flavor.

CARE OF FRUIT.—The *Western Rural* argues the necessity of using great caution to prevent fruit intended for long keeping from being bruised. When placing winter fruit in bins, boxes etc., it should be carefully handled, and all bruised and inferior specimens picked out from the choice fruit. Winter fruits of every kind should be entirely free from moisture.

FOUR SEASONS—Mustard, salt, pepper and vinegar.

Mechanical Hints.

GOLDEN COLOR TO BRASS.—A mixture of muriatic acid and alum dissolved in water, imparts a golden color to brass articles that are steeped in it for a few minutes.

HARD CEMENT.—A foreign journal says that a French mason, in repairing the stone steps leading into a garden, used Portland cement mixed with finely divided filings and borings of cast and wrought iron, instead of sand; and that the mass has become so hard that it cannot be broken either with hammer or pickaxe.

DURABILITY OF DIFFERENT WOODS.—Experiments have lately been made by driving sticks, made of different woods, each 2 feet long and 1½ inch square, into the ground, only ½ inch projecting outward. It was found that in five years, all those made of oak, elm, ash, fir, soft mahogany, and nearly every variety of pine, were totally rotten. Larch, hard pine, and teak-wood were decayed on the outside only; while acacia, with the exception of being also slightly attacked on the exterior, was otherwise sound. Hard mahogany and Cedar of Lebanon were found in tolerably good condition. But only Virginia cedar was found as good as when put in the ground. This is of some importance to builders, showing what woods should be avoided, and what others used by preference in underground work.

ROPES OF HEMP, HIDE, WIRE, ETC.—When your rope has to run over large pulleys, use wire rope; but if the pulleys are small, wire rope cannot long stand continual bending over curves of a short radius, and gives out; in this case use rope of strips of rawhide, which during the last two years have appeared in the market; they are nearly as strong as wire rope, and about as lasting. Or you may use catgut; or, rather, gut rope, as the heavy kinds are obtained from other animals; the latter however, can only be obtained of certain definite lengths, while hemp, wire and rawhide rope can be had of any length. In regard to the price where good half-inch hemp rope costs about two cents per foot at retail, rawhide rope will cost 15 cents, wire rope, 20 cents, gut rope, 75 cents per foot or thereabouts.

Elements of Success.

"The struggles of a life to achieve some great victory, are like the efforts of the traveler to reach the summit of one of the mountains of Switzerland, in the face of a raging storm. To turn back toward the monotonous plain would defeat and disgrace, to remain where he is, without shelter is certain death; and to advance a single step seems to defy and mock at Heaven. Yet he is impelled to go forward; for, at the summit, he knows that the shepherd of St Bernard will welcome him and afford him shelter; but the rugged path becomes obscured, and the faithful guide bewildered and at length he is ready to lie down and die, when in the dim distance he sees through the blinding snow the faint light of the good shepherd, and with one desperate, almost hopeless effort, he reaches the threshold and is safe. During the calm night that succeeds, the northern streamers shoot in every direction across the sky, flecking the serene heavens with their spangled pennants of gold and orange and fleecy white; and when the sun of the morning floods the mountain peaks and spreads the gorgeous, limitless panorama, he feels, as he never felt before, that the mountain height of victory is infinitely more glorious for the trials and dangers of the rugged ascent."

FIFTEEN GREAT MISTAKES.—It is a great mistake to set up our standard of right and wrong, and judge people accordingly. It is a great mistake to measure the enjoyment of others by our own; to expect uniformity of opinion in this world; to look for judgment and experience in youth; to endeavor to mould all dispositions alike; not to yield in immaterial trifles; to look for perfection in our own actions; to worry ourselves and others with what cannot be remedied; not to alleviate all that needs alleviation, as far as lies in our power; not to make allowances for the infirmities of others; to consider everything impossible which we can not perform; to believe only what our finite minds can grasp; to expect to be able to understand everything.

CHILDHOOD is like a mirror, catching and reflecting images all around it. An impious or profane thought uttered by a parrot's lips may operate on a young heart like a careless spray of water thrown upon a polished steel, staining it with rust, which no after-scouring can efface.

AUCTION SALE.

We will sell at public Auction, to the highest bidder for U. S. gold coin, on THURSDAY, December 28th, 1871 at W. A. Holcombe & Co.'s warehouse, the following described goods, to pay storage and advances, unless the charges are previously paid. Sale to commence at 12 M.

**CRAIG & BREVOORT'S**  
**Patent Condenser for Steam**  
**PUMPS, &c.**

NO. 1.

The annexed engravings represent a Condenser in-  
tended to be attached to the ordinary steam pump,  
thoroughly bringing it within the class of low pressure, or  
more properly speaking, of condensing engines; the  
steam, when it has done its work in the cylinder, in-  
stead of being exhausted into the atmosphere, is con-  
ducted to the condenser, on its entry into which, it  
meets the water drawn by the pump, and is immedi-  
ately condensed.

The Cut No. 1 represents a vertical section of the  
Condenser, and No. 2 an elevation.  
The flange D is bolted to the suction orifice of the  
pump, and the flange S to the pipe leading to the well,  
or whatever source of supply the pump may have; W is  
a water jacket surrounding the main chamber of the  
condenser, B, and with which the suction pipe, S, com-  
municates, permitting a free circulation of water within  
the jacket and into the hollow cover or top through the  
series of openings, one of which is shown at A, and  
from thence into the body of Condenser, B, through  
pipe P, carried by float F; the pipe P also acts auto-  
matically as a valve to enlarge or contract the space  
through which the water enters it, by which means the  
possibility of the condenser being at any time flooded is  
avoided. The pipe F, it will be observed, also acts as a  
guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or  
lowered by means of screwed stem—shown coming  
through elbow in Cut No. 2—is for the purpose of in-  
creasing or decreasing the flow of water according to  
the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into  
cover at E; the exhaust steam is thus thrown directly  
into contact with the water entering the condenser on  
its way to water cylinder of pump through D. A  
vacuum being of course immediately formed, acts on  
the exhaust side of the steam piston, aiding it in its  
work. If at any time it is desirable to run the pump  
without the condenser, it is only necessary to turn the  
three-way cock, which is placed in the exhaust pipe,  
into such a position as to cause the steam cylinder to  
exhaust into the atmosphere; when this is done the  
pump is perfectly free from the condenser, and acts as  
if it were not attached. This condenser is especially  
useful for pumps running in mines, or any other po-  
sition where trouble is experienced in getting rid of the  
exhaust steam. Address

### The Legislature.

The Inaugural ball came off at Sacramento on the evening of the 19th, and is reported as a grand affair, but owing to the stormy weather the attendance was not as great as was expected.

On Tuesday an election for U. S. Senator to succeed Hon. Cornelius Cole was held. Hon. A. A. Sargent and W. T. Wallace, of Santa Clara, were nominated. On the first ballot 118 votes were cast, of which Sargent received 72 and Wallace 46, and the former was declared duly elected.

A message from the Governor of Nevada was received in the Senate containing a joint resolution passed by the Legislature of that State asking the State of California to cede the territory east of the Summit of the Sierras to Nevada.

A bill has been introduced by Mr. Days of Nevada, providing that all mining corporations, employing twelve men, and having a shaft sunk to the depth of 300 feet or more, shall have an outlet beyond the main shaft, through which the men may escape in case of accident. And, should companies neglect to supply this means of escape, they may be held liable to the injured parties for damages.

Mr. Spencer, of Santa Clara, introduced a bill in the Assembly providing that parents and guardians having control of children between the ages of eight and fourteen years shall require them to attend school at least twelve weeks during the school year, and six weeks consecutively, unless they shall be excused by the Board of Trustees, on account of inability or on account of attendance at some private school. Any violation of the Act is made punishable with a fine varying as the offense is repeated.

Mr. Betge, of San Francisco, introduced in the Senate, a bill creating the office of and defining the duties of State Forester, and giving the appointment of the office to the Governor. The Forester is to receive a salary of \$3,000 per annum, and is to be allowed for traveling expenses \$2,000 more. His duties are to gather, exchange and import the seeds of timber and forest trees, and distribute the same to County Forest Boards as he may see fit, and, in the discharge of these duties, he is authorized to incur expenses not exceeding \$5,000 per annum. The Board of Supervisors of the several counties are to constitute County Forest Boards of such counties, but without compensation. The State Forester is also, at some convenient place, to establish a nursery for planting seed, and rearing trees, and acclimatizing foreign and exotic trees—this expense to be borne by the State, though not to exceed \$4,000 per year, including rent of land, labor, etc. He is required to visit the different counties, and see that the work progresses as he directs. The trees in the nursery, when grown, are to be distributed to the Forest Board according to climate and requirements. The bill further requires that all agricultural and horticultural societies, receiving State aid, shall award a special premium for the largest and best plantation of forest or timber trees grown subsequent to the passage of this Act. It authorizes the Boards of Supervisors of the different counties to levy a special tax, to constitute the Forest Tree Fund, to be expended in the procuring of forest trees and the planting of the same along the public roads, as protection from the sun.

On the 1st of December the Land office at Olympia was besieged with applicants for land on the west side of Budd's Inlet, quite a number of claims being taken a few miles from town. Probably the terminus is now going to Mud Bay.

### A Reason for the High Price of Mining Books.

The published works relating to Mining and Metallurgy are very limited in the English language, for several reasons. Appreciative purchasers are comparatively few, requiring but small editions, therefore necessitating high prices. Authors who are best informed and most reliable too seldom are willing to devote the necessary attention to write works while their time is so peculiarly valuable for other pressing engagements. Hence a practical work like the one we issue, by the authorship of Mr. J. S. Phillips (a permanent resident of this coast), is of more than ordinary importance in the literary calendar of American publications. It is the largest volume yet published on Mining and kindred matters written or printed on the Pacific Coast. The five volumes on Mining and Metallurgical subjects issued from the office of the SCIENTIFIC PRESS since 1864, comprise nearly all the important and successful books of this class printed during that period in the United States. We mention these facts because, compared with common literary publications for general reading, which, if successful, reach sales of over 100,000 copies, the price of every book on Mining and Metallurgy seems high, while in reality it may be sold at too low a rate to secure fair profit to a careful author, even if an unusually large sale is met with for such high and valuable class of works.

DEWEY & CO.

### A Valuable Work.

The Explorers', Miners' and Metallurgists' Companion, by J. S. Phillips, M. E., recently published by DEWEY & CO., San Francisco, is a work which will commend itself to the public, not only for the completeness and clearness of the information it supplies, but for the practical assistance it affords to men not scientifically educated, to do their own assaying. It is a handsome volume of 640 pages with 81 engravings. The work is divided into five sections, treating severally of Geology and Mineralogy, Explorations, Assaying and Discriminations, Mining and Engineering, and Metallurgy. We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*Golden Era*, Dec. 17th.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to obtain a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers', Brighton, Hongkong Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-ly

CROFT'S WESTERN WORLD is a large, spirited 8-page illustrated monthly (N. Y.) paper. Its object is to represent fairly the railroad and kindred interests of the West, and to present in a concise and convenient shape such information concerning Climate, Soil, Productions, Railroads, Lands, Farms, Local Industries, and Routes of Travel, as will prove most valuable to Tourists, Miners, and Settlers in the vast area "beyond the Mississippi River." We have received the first numbers, and must say it is worthy of great encouragement. An active and liberal minded publisher, we bespeak for Croft an immense success. Terms, \$1 a year. Address, 138 Nassau street, N. Y. del6-cow-bp

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. sc9-bpff

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at John I. Tay's, Broadway, Oakland. apl-hp-ff

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesmen at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 25v1-12nhp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12nhp

Patent Combination Carbolized Steam Fire Hose, Steam and Petroleum Oil Hose, Suction Hose, Hydrant Hose, Conducting Hose, Engine Hose, Round Packing, Rubber Belting, Packing, Valves, Caskets, Pure Vulcanized Sheet Rubber, Fire Buckets.

12v23-3m J. W. TAYLOR, Agent.

### N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, P, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23ff

### J. S. PHILLIPS, M. E.,

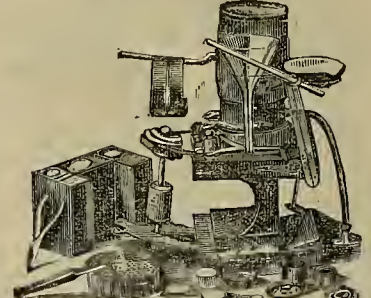

Examiner of Mines, Consulting Engineer,  
Mineral Assayer, Analyst, Etc., Etc.

423 Washington street.....San Francisco

Author of "The Explorers', Miners', and Metallurgists' Companion."

Inventor of the Explorers', Miners', Millers', and Smelters' Friend, the Prospectors' "WEE PET" Assaying Machine, etc., which obtained a Gold Medal at the San Francisco Mechanics' Institute Fair of 1869.

Patented September 7, 1869.

Arranged for the general purposes of this Analyst and Assayer.

Price, with instructions, tools and fluxes, \$100.

### Practical Instructions in all kinds of Assaying, Discrimination and Analysis.

20-v23-ff

### Seaton Mining Company—Location of

works, Drytown Mining District, County of Amador, State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 27th day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Ashburrow, Wm.....	51	1	\$20 00

BLISS, KEENE & CO'S Fluid Extract, the wonderful remedy for Cancer, Syphilis, Scrofula, Ulcers, Pulmonary Complaints, Salt Rheum, and all Chronic Blood Diseases, is prepared from the Genuine Cundurango Bark from Loja, Ecuador, secured by the assistance of the authorities of that country. It is the most effective, prompt and certain alterative and blood purifier known. Sold by all Druggists, in pint bottles, having on them our name, trade mark and directions. Send for a circular. Office and Laboratory, No. 60 Cedar street, N. Y. 25v23-3m

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening which is the very latest hour we can receive advertisements.

Alhambra Hill Mining Company—Location

of works, Alhambra Hill, Pinto District, White Pine County, Nevada.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of December, 1871, an assessment of (No. 1) of 50 cents per share was levied upon the capital stock of said company payable in United States gold coin, on the 13th day of December, 1871, to Henry G. Langley, 612 Clay street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 13th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. HENRY G. LANGLEY, Secretary.  
Office, No. 612 Clay street, San Francisco, Cal. d616

Altona Gravel Mining Company—Location

of works, Grass Valley, Nevada County, Cal.  
NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 31st day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:  
Names. No. Certificate. No. Shares. Amount.  
Beatty, Frank G..... 17 200 \$0.00  
Beatty, Frank O..... 271 18 4.50  
Cohn, L. B..... 229 200 50.00  
Cohn, L. B..... 264 18 4.50  
Dibble & Byrne..... 118 100 25.00  
Dibble & Byrne..... 119 100 25.00  
Dibble & Byrne..... 120 50 12.50  
Dibble & Byrne..... 272 23 5.75  
Dodge, D. F..... 270 36 9.00  
Orant, Emanuel..... 266 7 1.75  
Hooper, Aaron..... 227 100 25.00  
Hooper, Aaron..... 273 9 2.25  
Jeffrey, E. B..... 209 25 6.25  
Murbar, Martin..... 222 200 50.00  
Murbar, Martin..... 274 18 4.50  
Plukham, S..... 145 100 25.00  
Pinkham, S..... 258 9 2.25  
And in accordance with law, and an order of the Board of Trustees, made on the 31st day of October, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at No. 327 Montgomery street, San Francisco, Cal., on the 26th day of December, 1871, at the hour of 3 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
DAVID WILDER, Secretary.  
Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. d613w

Eagle Quicksilver Mining Company—Location

of works, Santa Barbara County, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of October, 1871, an assessment of Forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any share upon which said assessment shall remain unpaid on Thursday, January 10th, 1872, shall be deemed delinquent, and will be duly advertised on Saturday, the 6th day of January, 1872, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
W. M. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. nov14d

Nevada Consolidated Borax Company---

Location of works, Columbus and Fish Lake Valleys, Esmeralda county, Nevada.  
Notice is hereby given, that at a meeting of the Trustees of the above named company, held November 29th, 1871, an assessment of five (5) cents per share was levied on the capital stock of said company, payable on and after the 30th day of November, 1871, in U. S. gold coin, to the Secretary, at the office of the company, No. 420 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on Wednesday, January 10th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold at public auction on Monday, January 21st, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.  
J. L. SANFORD, Secretary.  
Office—Room 1, 3d story, No. 420 Montgomery street, San Francisco, California.  
San Francisco, December 6th, 1871. d9-5t.

Pocahontas Gold Mining Company—Location

of works, Mud Springs, El Dorado County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of November, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 16, Hayward's Building, No. 49 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
D. A. JENNINGS, Secretary.  
Office, Room No. 26, Hayward's Building, 49 California street, San Francisco, Cal. d25w

Quail Hill Mining and Water Company—Location

of works, Salt Springs Valley, Calaveras County, Cal.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 19th day of December, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, 409 California street (up stairs), San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23d day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 13th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
T. F. FROST, Secretary.  
Office, 409 California street, San Francisco, Cal. d23-w

Tecumseh Gold, Silver and Copper Mining Company—Location

of works, Gopher District, Calaveras County, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 5th day of December, 1871, an assessment of Three (\$3) dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, F. J. Herrmann, at the office of the company, No. 516 Kearny street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 9th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
F. J. HERRMANN, Secretary.  
Office 516 Kearny street d9td.

Best & Brown's Unrivalled Seed Separator.

PATENTED APRIL 25, 1871.

We wish to call the attention of Farmers, Millers and Threshers to the great usefulness of this Machine.

It makes a perfect separation of Barley, Oats, Abess, Pink Seed, Kale and Mustard Seeds, and other impurities from Wheat, rendering the finest grain (either Wheat, Oats or Barley) perfectly clean and fit for seed at one operation—common hand mills are nowhere.

We Guaranty Every Machine to do Perfect Work

at the rate of Thirty to Sixty Tons a day. They can be conveniently attached to and run in combination with any threshing machine, and driven by the same power.

We wish it distinctly understood (and we mean all we say) that we clean grain that is too foul for the flouring mill separators, at one operation.  
Light Horse Powers, adapted to driving the Separator, furnished to order.  
State and County Rights for sale on reasonable terms.

For further particulars address

BEST & BROWN.

Manufacturers and Sole Proprietors of the Patent, Marysville, Cal.

THE PATENT

Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to R. STONE, 25v22-3m 422 Battery street, San Francisco.

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works. Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.

## The California Powder Works

No. 314 CALIFORNIA STREET,  
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE  
MILLS. It being constantly received and transported into  
the interior, is delivered to the consumer within a  
few days of the time of its manufacture, and is in every  
way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our  
products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive  
now in use, and the lifting force of the BEST BLASTING  
POWDER, thus making it vastly superior to any other  
powder now in use.

A circular containing a full description of this Pow-  
der can be obtained on application to our Office.

JOHN F. LOHSE, Secretary.

## I. N. WILFONG'S

PATENT CIRCULATING

## STEAM BOILER.

This cut represents an improvement on the old  
style of Cylinder Boiler, and combines all the fol-  
lowing great advantages: Rapid circulation and  
generation of steam; economy in fuel; durability,  
safety, and simplicity of construction; requires but  
little attention; is easily repaired, and moderate at  
first cost.

We have now a number in successful operation,  
and respectfully refer to the following well known  
parties: Hastings & Co., Seventh and Cherry streets;  
Jos. Lea & Co., 228 Chestnut street; J. S. Huber,  
Germantown; Holt & Bro., Sixth and Susquehanna  
avenue; Albion Print Works, Conshohocken, Pa.; S.  
H. Dickey, Oxford, Pa.—all of which are giving EN-  
TIRE SATISFACTION. Parties wishing to investi-  
gate the success of our new Boiler can do so by call-  
ing at any of the above named places, or to

## Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they  
have no equal. No effort has been, or will be spared,  
to have them constructed in the most perfect manner,  
and of the great number now in operation, not one has  
ever required repairs. The constant and increasing de-  
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly  
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces  
the pulp to the center, where it is drawn down through  
the aperture and between the grinding surfaces.—  
Thence it is thrown to the periphery into the quicksilver.  
The curved plates again draw it to the center, where it  
passes down, and to the circumference as before. Thus  
it is constantly passing a regular flow between the grind-  
ing surfaces and into the quicksilver, until the ore is  
reduced to an impalpable powder, and the metal amal-  
gamated.

Settlers made on the same principle excel all others.  
They bring the pulp so constantly and perfectly in  
contact with quicksilver, that the particles are rapidly and  
completely absorbed.

Mill-men are invited to examine these pans and settlers  
for themselves, at the office, 229 Fremont Street,  
San Francisco.

## To Inventors in the Pacific States.

The best, speediest, and a sure method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years, Explorer, and Resident in the Pacific States and Territories for the past six Years.

Now issued and for sale by DEWEY & CO., Patent Agents, Publishers "Scientific Press."

### General Analysis of Contents.

## Section I.—GEOLOGY AND MINERALOGY.

CHAPTER I.—Formation of the Earth, from its initial chaotic state to the time of the partial elevation and solidification of its primitive granitic mountains.

2.—Formation of the first clay slates, greenstones, quartzites, hornblendes, and various fine-grained felspathic mixtures, from primitive rock elements.

3.—The rock formations of the Paleozoic, Mesozoic, and Cenozoic times; wherein the footprints and fossiliferous remains of animated nature unfold evidence of their presence and progressive continuance, from first mere existence to perfection.

4.—Theory of Earthquakes; the mighty powers that have fractured some of the mineral sections of the earth's crust into separate belts of rock, within the opening walls of which the minerals have been since deposited.

5.—Formation of Veins; of the "True fissure veins" in the Azoic and metamorphosed Paleozoic rocks. Of converging and wedge veins in the convex upper sections of upheaved bed-rock. Of veins that are more or less conformable to the general cleavage of tilted stratum, in the seams of which the matrices, minerals and metals have been deposited. Of veins that intervene and separate two distinctly different strata, as granite and slate, slate and limestone etc. Of gash veins. Of cross courses. Of slides. Of dikes. Of carbonaceous, bonanza, pockets, and floors. Of irregular sublimations, alluvial distributions, and sedimentary deposits.

6.—The supposed actions and reactions that have been and are continually taking place in mineral veins, pockets and deposits. How minerals were formed. How gold, platinum, and other similar metals were formed.

7.—The peculiar characteristics of "True fissure veins" and their constituent combinations. Positions, directions, and dips. General comportment when traversing different strata, when forming intersections and junctions with each other, or with cross courses, dikes and slides. Counteractions and general influence of cross courses, slides, and dikes. Summary of the effects produced by collective causes.

8.—The more generally recognized premonitory indications in the shallow portions of veins, for probable increase of mineral in depth.

## Section II.—EXPLORATION.

CHAPTER I.—Prospecting.

1.—How to explore.

2.—Where to explore.

3.—The peculiar kinds of the primitive and secondary rocks, that concern the miner, as being most congenial for rich veins; and what formations should be avoided.

4.—The prospector's and locator's preliminary exposition of the general features of a vein, so as to ascertain its approximate value, previous to location and development by the miner.

## Section III.—ASSAYING AND DISCRIMINATIONS.

CHAPTER I.—Systematic preparation of the sample, to obtain average equality, for discrimination or assay.

2.—Description and general advantages of the "explorer's, miner's, miller's, and smelter's friend," the portable, "wee pot" assaying machine.

3.—New methods for the examination and assay of ores, by water-washed concentrations, sometimes perfected by acid solutions, or mercury, and completed, when necessary, by roasting, and fluxed fusion, with crucible, scorifier and machine.

4.—The methods for discrimination, by blow-pipe assaying machine, of such of the metals, metallic minerals, and earths, with their combinations; that should be known by the explorer, miner, miller, smelter, assayer, and metallurgist.

5.—Discrimination of the profitably useful minerals, by a new method, for practical men.

6.—An alphabetically arranged record of the effects produced by water and fire, sometimes assisted by water and chemical reagents on the minerals and such of their compounds as will be practically useful and profitable to the explorer, miner, and metallurgist.

7.—Assaying of gold and silver, by ten different methods.

8.—Assaying of Lead.

9.—Assaying of Antimony.

10.—Assaying of Copper, by acids and by fire.

11.—Assaying of Tin, by water, acids, and fire.

12.—Assaying of Mercury.

13.—Assaying of Iron.

14.—Assaying of Manganese and Zinc.

15.—Assaying of Coals.

## Section IV.—MINING AND ENGINEERING.

CHAPTER I.—Education of a Mining Engineer.

2.—Systematic and more extensive excavations, for the examination of the supposed rich vein.

3.—Mechanical Engineering, above and below the surface.

4.—The Cornish hydraulic engine; steam-pumping engine; pumps, etc.; hand and steam capstan, hoisting machines, tram-roads, and man engines.

5.—Deep mining, as facilitated by such machines.

6.—The Cornish crushing, stamping, fluming, jigging, buddling, framing, and roasting machines.

7.—Dry and wet concentration of ores, by hand, water, and acids; and by calcination.

8.—Preparing and sampling the ores for the market, etc.

9.—Contracts, setting, paying, and account days.

10.—The most important and more frequently recurring errors in mining, which may be more easily avoided than committed.

## Section V.—METALLURGY.

CHAPTER I.—Roasting.—Roasting of peculiar ores, to reduce their weight for cheaper conveyance to the market.

Roasting refractory milling ores. Roasting to obtain the volatile element, in marketable purity. Roasting preparatory to chlorination, or other chemical reduction. Roasting for regulus.

2.—MILING.—By battery, with water and masonry. By battery, dry, for after treatment; by roasting and pan amalgamation, by chlorination with Plattner's process, or other chemical manipulation. Milling with iron pans; in copper-bottomed pans; in arastras; in the Chilian mill; and with close revolving barrels.

3.—CHLORINIZING.—Plattner's original method. Furnace chlorination, etc.

4.—SMELTING.—Smelting by natural draught, in reverberatory furnace. By blast in cupola furnace. By various other means.

CHEMICAL REDUCTION.—By several of the best known methods.

PRICE, bound in cloth, \$10 (in coin or its equivalent). In leather, \$12. Postage, 50 cents extra. Address all orders (wholesale or retail) to

## IMPORTANT MINING DECISION—MINING CLAIMS ON SCHOOL SECTIONS.

The Register and Receiver of the United Land Office, at Sacramento, has recently made an important decision in the matter of the attempt, on the part of certain parties, to obtain by means of a purchase from the State, for four hundred dollars, the legal title to the Keystone, Original Amador, and Bunker Hill mines, worth in market probably nearly two million dollars.

These mines have been occupied and worked for nearly twenty years, and the Keystone is deemed by many experts the best gold mine on the coast. Upon survey of the section lines of that township by the United States in 1870, these mines were found to be located on east half of Section 36, in township 7 north, Range 10 east, Mount Diablo meridian.

As section 16 and 36 in every township (with certain exceptions) were by act of Congress approved March 3, 1853, granted to the State for school purposes, some party seems to have jumped to the conclusion that, by purchasing from the State of California the half section on which these mines are, he could get the legal title to the mines.

The facts, as detailed in the opinion of the officers, show a gross fraud in the survey of the section lines of the township in not noting the location of Amador City, a town of 500 people, entirely built up by these mines, and in incorrectly locating it upon the plat of the Keystone Mine. The photographic views taken from the lines of the section, showing the town and the mines in full view from these lines, are stubborn witnesses of the fraud.

Nor does the State Land Office seem to have steered entirely clear of apparent complicity in this attempt to take from the mine owners their property. In the ordinary course of business, under the State statute providing for the sale of State School lands, an application of their purchase cannot be approved until the certificate of the Register of the proper U. S. Land Office shows that the township has been surveyed for three months, and that no conflicting claim is on file in the United States Land office. In this case the sale was made upon the certificate of the Register of the United States Land office that the plat had been on file three days, and that no conflicting claim had been filed. Mr. Casey, the purchaser, was allowed, upon this certificate, to purchase the State's title for \$1.25 per acre; or, \$400 for the half section embracing these mines.

Within the three months after the plat was filed, the mining companies filed their several claims, and one pre-empting declaratory statement was filed, taking in a portion of this half section. The County Judge, also, within that time filed his application to enter the town site in trust for the inhabitants of Amador city.

But the Register and Receiver have taken a different view of the matter, and one which seems much more consonant with law, as well as with justice. They hold—

1. That the grant of sections 16 and 36 to the State possesses no title until the United States survey of the sectional lines of the township is made; that until the section lines are run and platted, there is no section 16 or 36 to pass by the grant.

2. That until such survey, the United States is at liberty to make any other disposition of the land, which becomes section 16 or 36 upon survey; the State in such case, to take other land in lieu.

That the Act of Congress authorizing miners to locate claims on the public land

and procure patents for the same, approved July 26th, 1868, legalized the occupation of these mines by these in possession, the township not being yet surveyed by the United States, and that the title thus vested in them to the exclusion of any right of the State under the school land grant; so that the miners were entitled to receive patents upon making the proper application, proof and payment.

That even if this were not so, still the State would have no title to this half section under the school land grant, inasmuch as there was a town thereon, not only before survey, but even before the school land grant was enacted; and also a cultivated field long before survey.

The land officers further hold that the settlement of the inhabitants of Amador City upon this land was lawful under Section 8 of the Act of March 3, 1853, which gives to the inhabitants of town sites on

of the mountain streams occupying and rushing down cañons, whose sides are almost perpendicular walls of rock, and often three thousand feet or more in height, and along which the pedestrian can only make his way for a hundred yards together, by taking to the head of the stream.

It is from such cañons, that the water is mostly obtained for the supply of our mining canals and ditches; and it is not unusual that from three to ten miles of wooden flume is required at the upper end, before the water can be brought out of the cañon sufficiently high to oertop or command the ridges and foothills of the lower country, in which the mines and placers are principally found.

To lift as it were, the waters from these

FLUMING OVER A GORGE.

mineral lands "the right of occupation and cultivation" of said land "until such time as Congress shall dispose of the same."

### Fluming.

Only those who are familiar with the physical formation of the mountain and gold region of California, have anything like an adequate idea of the vast amount of labor expended, in the construction of our artificial water-courses that supply the mining canals and ditches with water from the mountain streams.

To hear of the construction of a hundred miles of mining ditch, conveys but a feeble conception of the magnitude of the enterprise, or the difficulties to be overcome. The mountain country from which the supply of water is obtained, does not consist of slope upon slope, or of successive tables of comparatively level land, and rising one above another: but from the foot hills, the mountains rise to the height of from seven to nine thousand feet, in one uninterrupted succession of immense ridges, lying in every conceivable direction and position, with intervening gorges or cañons of corresponding depth; and by this we mean, of very great depth; many

deep cañons, or rather to convey them at a fall of from five to twenty feet to the mile, out of them, often requires many miles of flume constructed entirely of wood, because the steep sides have not, in many places, a single inch of earth in which to excavate a ditch; and even the rocky sides often so high and steep as to require the flume to be constructed upon trestle work, a hundred or more feet in height; and even in some instances actually suspended by iron work, upon the smooth face of almost overhanging rock and precipices; the workmen are let down and suspended by ropes from above, while prosecuting their arduous labors.

Then again, the flume is made to span a vast gorge sometimes, as shown in our illustration, which is from *Hutchings' Magazine*, and in places supported by timber work from beneath; at others, by suspension from the sides; and in its tortuous course, running up and crossing adjacent gorges, perhaps to take in the waters of some small tributary, and then again heading for and coursing along the great main cañon, leaping as it were, from point to point of jutting crag and cliff, till at last it reaches the more earthy side or summit of

the ridge, there to be at once used for gold washing, or milling purposes, or conveyed by ditches in countless ramifications to the lower mining world; and these enterprises constitute the great fulcrum of our mining prosperity.

### Canal Propulsion.

Our inventors seem to be moving quite briskly in the matter of securing a better means of propelling canal boats, judging from the number of recent patents on this subject. It is only necessary to create a demand and the versatile genius of our Yankee inventor will soon supply all that is required. We had hoped that the honor of furnishing the required improvements and receiving therefor the prize offered by the State of New York would be given to some of our Pacific Coast inventors, but thus far we have heard of no particular attempt on the part of inventors on this Coast to compete for the prize. We are the more astonished at this fact from knowing that several new and quite promising inventions for propelling vessels have been patented and tested at considerable expense with results which to our minds evidenced their availability for propelling canal boats.

One of these devices which gave good experimental results in propelling a vessel in our bay, it seems to us would be particularly applicable for canal boats. We refer to the propeller of Thomas Finlayson now of Folsom, which was tested by Mr. A. C. Loud of this city, over a year ago, and although the results were not such as to effect its adoption upon seagoing vessels yet for canal purposes it appears to fulfil to a remarkable degree all the requirements of the Act of the State of New York which were to be the test of the successful competition for the prize.

The device consists of one or more wheels of the Turbine order, in appearance, but really a reversion of the Turbine water wheel, fixed on a shaft and enclosed in an air tight case in the bottom of the vessel. This case has two openings below the boat, through one of which the water rushes inside the case and is forced out through the other by the centrifugal force of the revolving wheel, causing a vacuum which draws in the water. By this means the inventor secures not only the resistance of the water but the atmospheric pressure of fifteen pounds to the square inch. The device occupies but little room and creates but little agitation of the water, appears to us to possess peculiar advantages for canal uses.

### Pictorial Engravings.

During 1871 we have presented the readers of this journal nearly 300 handsome engravings in its 832 pages. Many of these engravings were drawn expressly for our readers, and our general selections have been made with a view to their appropriateness to our special Pacific Coast readers. We have the assistance of the best designers in San Francisco, and regularly employ some of the best engravers in the United States, as can be proved by samples of their work. With improved and increased force in this department of our establishment, we promise a still better display of interesting engravings for the coming year.

# MECHANICAL PROGRESS.

## Mode of Manufacture of Russia Iron.

It has generally been supposed that the process of manufacturing Russia sheet iron was guarded as a great secret by the Russian government; but Mr. John Percy, in a lecture recently delivered before the Royal School of Mines, London, remarked that it has recently been ascertained that this secrecy was more dependent on ignorance of the Russian language than on anything else, and proceeded to give the *modus operandi*, which we condense from *The Builder*, as follows:

The iron which is the subject of this manufacture, is derived from pig-iron, obtained by smelting the following ores with charcoal in cold-blast furnaces—namely, magnetite, carbo-nate of iron (*sphaero siderite*), and red and brown hematite. The conversion of the pig-iron into malleable iron is effected either in the charcoal-furnace or in the puddling furnace.

The puddle-balls intended for the manufacture of sheet iron, are rolled into bars 5 in. wide and  $\frac{1}{4}$  in. thick. The iron should be more crystalline than fibrous, and should contain sufficient carbon to render it more like steel than iron. The machinery required consists of one or two pairs of rolls and two kinds of hammers. Reheating is conducted in furnaces of particular construction. The rolls should make not fewer than 50 revolutions a minute. The hammer-heads are of wrought iron, with striking faces of steel. Each anvil consists of a solid block of white cast iron. It is necessary that the hammers and anvils should be so made, in order that they may have the requisite hardness, in default of which the surfaces of the sheets would not acquire sufficient brightness or polish.

The bars are heated to redness, and cross-rolled into sheets about 29 in. square; and in order to become thus extended, they require to be passed through the rolls about 12 or 14 times. The sheets thus produced are arranged in packets of three in each, heated to redness, and rolled, each packet passing through the rolls about 10 times. But just before rolling, the surface of each packet is cleaned with a wet broom, usually made of the green leaves of the silver fir, and powdered charcoal is strewn between the sheets.

The sheets obtained from this rolling are sheared in the dimensions of 28 in. by 56 in. Each sheared sheet is brushed all over with a mixture of birch charcoal powder and water and then dried. The sheets, so coated with a thin layer of charcoal powder, are arranged in packets containing from 70 to 100 sheets each; and each packet is bound up in waste sheets, of which two are placed at the top and two at the bottom. A single packet at a time is reheated, with logs of wood about 7 ft. long placed round it, the object of which is to avoid, as far as possible, the presence of free oxygen in the reheating chamber. The gases and vapors evolved from heated wood contain combustible matter, which would tend to protect the sheets from oxidation in the event of free oxygen finding its way into the reheating chamber.

The packet is heated slowly during five or six hours, after which it is taken out by means of large tongs and hammered. The packet is moved so that the blows fall in an indicated order. After this treatment the surface of the packet presents a wavy appearance, as the striking face of the hammer and the face of the anvil are both very narrow. When the packet has traveled about six times under the hammer, in the manner specified, it is removed; and immediately afterwards completely finished sheets are arranged alternately between those of the packet.

The actual cost of manufacturing these Russian sheets is about \$64 per ton, to which must be added general charges, which raise the amount to \$83 per ton, exclusive of profit. The average price of sheet iron at the fair of Nijni-Novgorod is from \$110 to \$125 per ton.

**ENGRAVING ON GLASS.**—Instead of using aqueous hydrofluoric acid for engraving on glass, M. Siegwart recommends a solution of eight parts of any alkaline fluoride dissolved in one hundred parts of water, mixing this solution just previous to use with one part of oil of vitriol. In order to remove every trace of organic matter, the glass before immersion in this bath should be thoroughly cleansed with a solution of bichromate of potassa, acidulated with oil of vitriol. A few hours' exposure is stated to be sufficient at ordinary temperatures to obtain a fine frosted surface.

## Repairing Machinery.

The inevitable waste and wear which always, in the end, necessitate the abandonment of everything in its day useful to mankind, is compensated for and retarded by repairs. But in the attempt to do this, there is often much time and money uselessly squandered.

One of the principal causes of loss is delay in making timely renovations and substitutions; another is injudicious ways of repairing; and, lastly, repairing that which it were wise to abandon altogether. Instead of at once correcting what is amiss in a tool or a machine, many will let it run as long as it is possible to work with it, when it is often found impracticable ever to make it serviceable again; or, if not so badly injured as this, that one deficiency, which it would have cost little to supply, has caused many worse than the first.

In making repairs it is often thought a poor mechanic will do just as well as better and more costly skill. No greater mistake can be committed. We assert that the mechanical ingenuity, ready command of resources, knowledge of the adaptability of means to ends, skill of eye and hand, common sense, and sound judgment—which go to make up an accomplished mechanic—are more necessary in a repair shop than anywhere else. Here it is not the same old routine, day after day, the making and putting together of forms so familiar as to require little original thought; but every job varies in some particular from every other, and each must be repaired in a different way. It requires brains as well as manual skill to do this kind of work in a creditable manner, and every manufacturer will find it policy to put a first-class mechanic in his repair shop.

Lastly, in constantly etopping old machines to patch them up into make-shifts, there is often more money sunk than would supply their places with new ones. Many people estimate the cost of repairs only from the cost of material and labor; but in many cases the time lost in repairing is the largest element of expense, especially when the stoppage of one machine entails the stoppage of many others.

In repairing machines the following rules ought, therefore, to be observed: First. Repair as soon as anything gets out of order. Second. Intrust none but good mechanics with repairs. Third. Be careful not to continue repairs when machines cease to be worth them.—*Scientific American*.

**IRON AND STEEL.**—Mr. Gerhard, metallurgical chemist, of Wolverhampton, Eng., is proceeding with his experiments in the manufacture of iron, and has succeeded in producing from the ore, refined iron of a high order, at much under the cost of a similar quality very much sought after by certain machine founders and producers of finished iron. Mr. Gerhard, however, aims at the making of steel at much less cost than any of the methods now in vogue, and he has much confidence that he will soon succeed. He believes that he can see his way to the production of finished iron, in a pure state, without the interposition of the puddler.—*Journal of Society of Arts*.

**CUTTING BEVELS.**—The following is given by the *Scientific American*: 1st. Draw a rectangular parallelogram, the shortest side corresponding with the thickness of the board to be mitered, the other side with a line cutting the board horizontally when set at the required flare. Draw the diagonal line and the angle formed by the diagonal, and the shortest side is the required miter. If different sides of the box or seat flare unequally, each side must be treated by the same rule separately. 2d. Add half as many degrees to the miter angle (45°) as the side of the box deflects from the perpendicular. For instance, if the side of the box flares at an angle of 45°, an angle of 67½° will miter the corner.

**HOW FINE IRON CASTINGS ARE MADE.**—The finest castings of iron and bronze are made by using models of wax. These are imbedded in moulds made of fine ground earth, which are then heated red-hot. The mould is baked, the wax disappears, and the metal, when poured in, exactly takes its place. The wax model is often made in a gelatine mould, which, being very elastic, will slip off the original object which is to be copied into metal.—*American Artisan*.

**IMPROVEMENT IN MAKING STEEL.**—A new process for making steel has been invented by a Frenchman, and adopted at the steel-works in Givors, which requires from an hour to an hour and a half, and is so conducted that it can be arrested at any moment, and any desired quality of steel obtained.

# SCIENTIFIC PROGRESS.

## What Railway Dust is Composed of.

Mr. Joseph Sidebotham has made a microscopical examination of dust blown into a railway carriage near Birmingham. He says: "I spread a paper on the seat of the carriage, near the open window, and collected the dust that fell upon it. A rough examination of this, with two thirds power, showed a large portion of fragments of iron, end, on applying a soft iron needle, I found that many of them were highly magnetic. They were mostly long, thin, and straight, the largest being about 1-150th of an inch, and, under the power used, had the appearance of a quantity of old nails. I then, with a magnet, separated the iron from the other particles.

The weight, altogether, of the dust collected was 5-7 grains, and the portion of those particles composed wholly, or in part of iron was 2-9 grains, or more than one half. The iron thus separated consisted chiefly of fused particles of dross or burned iron, like 'clinkers,' many were more or less spherical, like those brought to our notice by Mr. Dancer, from the flue of a furnace, but none so smooth; they were all more or less covered with spikes and excrescences, some having long tails, like the old 'Prince Rupert's drops'; there were also many small, angular particles like cast iron, having crystalline structure.

The other portion of the dust consisted largely of cinders, some very bright angular fragments of glass or quartz, a few bits of yellow metal, opaque, white, and spherical hodie, grains of sand, a few bits of coal, etc.

After the examination of this dust, I could easily understand why it had produced such irritation; the number of angular, pointed, and spiked pieces of iron, and the *Scoria*, or clinkers, being quite sufficient to account for the unpleasant effect.

I think it probable that the magnetic strips of iron are laminæ from the rails and tires of the wheels, and the other iron particles, portions of fused metal; either from the coal or from the furnace hers. The large portion of iron found in the dust is probably owing to the metal being heavier than the ordinary dust, and accumulating in cuttings such as those between the two stations named.

If I had to travel much by railway through that district, I should like to wear magnetic railway spectacles, and a magnetic respirator in dry weather.

## Science in Prussia.

Sir William Thomson stated in his recent address before the British Association, that in Prussia every university, every polytechnic academy, every industrial school, most of the grammar schools, in a word nearly all the schools superior in rank to the elementary schools of the common people, are supplied with chemical laboratories and a collection of philosophical instruments and apparatus, access to which is most liberally granted by the directors of these schools to any person qualified for scientific experiments. In consequence there will scarcely be found a town exceeding 5,000 inhabitants that does not offer facilities for scientific investigations at no other cost than that of the materials wasted in the experiments. And further, professors, preceptors, and teachers of secondary schools are engaged on account of their skillfulness in teaching; but professors of universities are never engaged unless they have already proved by their own investigations that they are to be relied upon for the advancement of science.—*Scientific American*.

**EFFECT OF COLD ON GAS.**—It may surprise some of our readers, who have given no attention to such subjects, to learn that the illuminating power of gas depends in a very marked ratio upon the temperature of the air in which it is burned. True, it has been found, taking the amount of light emitted at 65 degrees of Fahrenheit as a standard of 100 parts, that at 32 degrees, or the freezing point, the percentage of light is only .76; and that at 4 degrees above zero it is only .33, or about one-third of what it is at 65 degrees. On the other hand, increased heat if not accompanied by a corresponding amount of light, since the temperature of boiling water causes an increase of only four per cent. over the standard; and that of 320 degrees, or boiling paraffine, only 18 per cent. The loss of illuminating power upon the application

of cold is supposed to depend directly upon the condensation of the hydrocarbon vapors; since, at a temperature of 4 degrees a solid mass was found congealed upon the sides of the tube, containing, among other substances, benzole, ammonia and nitric acid.

## A Resisting Medium in Space.

One of the chief arguments in support of the theory of a resisting medium in space, has been deduced from the retarded motion of Encke's Comet, which, just now, is attracting marked attention from astronomers. Professor Encke pursued his studies and calculations upon his favorite theory of a resisting medium, in connection with the movements of this comet, for more than forty years, or until within a short time before his death, which took place in 1865. In 1861 he published a resumé of his labors, which seemed to put the truth of his theory beyond a doubt. There are, also, two other comets, Faye's and Winneck's, which have furnished important evidence on this question.

Prof. Moëller, of Sweden, has devoted much time to calculating the movements of the latter named comet, end up to 1865, was inclined to agree with Encke in his theory of a resisting medium. But in 1865, in revising his calculations with regard to Faye's comet, he discovered an error, by correcting which he was enabled to refer the movements of that body to a strict conformity with the laws of gravitation, independent of a resisting medium in space. So accurate was his prediction of its next return, that upon the first night it was sought for it was found in exactly the predicted place—the most accurate calculation of the return of a comet ever made. In view of this error the Professor is inclined, notwithstanding a very small unexplained perturbation observed in Winneck's comet, to conclude that the movements of that body are also in strict conformity with the laws of gravitation. He also thinks, for reasons given, that a careful revision of Professor Encke's calculation will lead to a similar result.

Hence, so far as the motions of comets have been determined, the evidence is against the theory of a resisting medium in space; while no one has ever referred any retardation in the movements of the planets to any other than the disturbances of known bodies. If it should be proved that a retardation actually exists in the movements of Encke's comet, there are other causes, now admitted possible, to which such retardation may be attributed, other than a resisting medium. We have condensed the above from an article by Asaph Hall in the December number of the *American Journal of Science and Art*.

**HEAT ON THE GROWTH OF PLANTS.**—A paper has recently been published by Koppen, upon the relationship of conditions of heat to the phenomena of growth in plants; his first inquiry being limited to the question connected with the germination of the seed. The general conclusion arrived at was that varieties of temperature were in all cases prejudicial to the growth of the germ, even when amounting to but a few degrees, and these within limits favorable to energetic growth. That is to say, the germination process more rapidly at a low temperature of a uniform degree, than a higher, where subjected to more or less variation. From that we derive the inference that a nearly uniform spring temperature, with a clouded sky, is more favorable to rapid development of vegetation than the alternation of hot days and cool nights, it being of course understood that the mean temperature in each case is about the same.

**A NEW MINERAL.**—Prof. F. Sandberg announces a new mineral from Guadalcanal, Spain, which he names glaukoppyrite, and which has the following centesimal composition: sulphur, 2.36; arsenic, 66.90; antimony, 3.59, iron, 21.38, cobalt, 4.67; copper, 1.14. It occurs, associated with carbonate of lime, tetrahedrite, and pyrrargyrite, in rounded aggregations, which, when magnified, are found to be composed of a series of thin layers. Its color is a light led-gray, approaching tin-white.

**SOLUBILITY OF METALS.**—Mr. Chas. A. Leely of New York, has recently been experimenting on solubility of metals without chemical action. Among other matters he has been investigating the properties of ammonium amalgam, which, from the mercury being increased ten fold in bulk, and also from the fact that it is compressible in a syringe, recovering, however, both its volume and appearance on pressure being removed, he believed to be a mercuric froth rather than an amalgam.

## CORRESPONDENCE.

### LETTER FROM SONORA, MEXICO.

EDITORS PRESS:—As there is considerable California capital already invested in this part of Sonora, and a good probability that much more will soon follow, I have thought that a little plain talk about things here in general, and mining in particular, may be of interest to your readers. I will promise to tell the truth, as near as can be expected of a man who has seen the ups and downs of Mexico for the last nine years, and become somewhat naturalized to the ways of her people, and more or less informed as to her natural resources.

My earnest advice to all that depend on their labor, is to stay in California, or keep away from this country, at all events; for all kinds of labor are paid less here than in California or the Territories. Even skilled mechanics are paid less here, and that is the only class that can get anything to do. The common labor here is performed by the natives at a price that a foreigner would starve on; and I do not exaggerate when I say that the richest man in Sonora does not live as well as an ordinary mechanic in San Francisco. The materials for good living cannot be obtained here. I have read eloquent dissertations on the tropical fruits, and of their abundance; but I have not seen them in any abundance during my nine years wandering over a large portion of four States of Mexico. There are all kinds of tropical fruits here, but they are not abundant or cheap enough to come into general consumption.

This state of affairs may appear incredible, but it is too true; and that, too, with a country unequalled for natural resources. Sonora and Sinaloa, in particular, have the finest sugar lands in the world, and millions of acres of them; yet sugar is imported from Cuba, refined in San Francisco, and sent here and sold to the consumer at an average of 37½ cts. per pound. With millions of acres of corn and wheat land, the people are starving here to-day. Indolence, ignorance, and keeping of feasts established by the Church, has much to do with this; but the main cause is the want of security and protection to life and property.

#### The Mines.

Mining enterprise, as a general thing, receives more protection than any other; but that is because the mines furnish the great source of revenue, and a crowd of pronounciadores cannot pack off a mine as easy as they can a herd of stock. The steam engine is quietly working out the mining problem and proving that Sonora, with all its drawbacks, has good mining properties and paying ores. As a general thing they require a large outlay of capital to develop them, and should there be peace and quiet as we have had it the last two years, the time is not far distant when Sonora will redeem her credit and establish the fact of her being one of the richest mining countries in the world. [This was written before the late revolutionary outbreak.—EDS. PRESS.]

The law allowing the shipment of ores out of the country is gradually drawing foreign capital here, particularly English and German, and it wants but a slight change in the law so as to allow bullion to be shipped free to draw an immense capital hither. Even a permission to ship base metal bars would work a wonderful change in mining here, for there are a great many mines near the coast that would pay well if the produce could be sent out of the country and refined, where the base matter can be turned to account. Now only those mines can be worked which yield very docile ores, such as can be worked in the patio, or those that have very rich lead ores which can be worked in the vaso. The pan process, so far in this district, has been a failure, more from the want of practical men to work it than anything else, and it has been condemned without a fair trial. My experience tells me that ores that can be worked by the patio process, as a general thing, will give a better result in the pans.

#### Extensive Patio Works.

The Tirito & Almado Co. has just com-

pleted the putting up of two pans, and a practical pan man is going to give them a thorough trial. Should they succeed, it will make many thousands of dollars in that company's favor, for they have such an abundance of docile ore from \$35 to \$70 per ton, that they will have to build over ten acres of patio. They have now a patio that takes over 300 tons to fill, and it don't begin to take the stuff from a 30-stamp mill, and that running only half time, with a mountain of ore on the dump, from one or two levels in the Tirito alone. What will it be when they reach the Providencia and Mina Grande, where the ore is known to be 41 feet wide, solid, clean ore? They are pushing on the tunnel level as fast as it can be driven; it will drain the Mina Grande and the Dios Padre, the adjoining mines on the north, over 600 feet deep.

The Dios Padre Co. are sinking a shaft on the south end of their property, which is now down 315 feet and will be completed by the time the tunnel drains the lower works of the Mina Grande, and without a doubt it will drain the Dios Padre also. If it does not naturally, a short level drawn south on the vein will open the communication and let the water pass off.

#### Other Mines.

I understand that the Dios Padre Co. is making some arrangements to reorganize or join with some English capitalists to put in a tunnel from the Alamos side of the mountain. The tunnel would be about 6,000 feet long to strike the Dios Padre at a depth of 800 feet. Quintoro and Libertad it would cut some eleven or twelve hundred feet deep. I hope they will go on with it for it would develop one of the largest and best mining properties in the world, for the tunnel will run through and under the deepest workings of the most famous mines of Sonora—Quintoro, Libertad, and Dios Padre, to say nothing of many small veins that it would cross-cut.

The Quintoro Co. are putting an engine and hoisting gear on their main shaft and expect to be in a "bonanza" soon. The last work done in the lower levels took 60 men to man the pumps, and they could only work three fronts so they abandoned the lower works and took out the pillars above the water level.

That is the history of all the mines in this district. They worked them down until the water became troublesome, then took out the pillars and turned the mine over to the garbociras (?) and they leave it beyond redemption, only by running a tunnel or sinking a shaft below the old works and putting up modern machinery to facilitate the work.

#### General Remarks.

This district is situated very favorably for mining enterprise. There is a good natural wagon road to two ports on the coast, so that machinery can be hauled to either of the mining centres, viz: Promontorio or the Aduano. Wood for fuel is abundant, delivered at \$6 per cord. Salt can always be laid in at about \$20 per ton. Lime and building material is abundant, except for heavy square timber; they have to be packed out of the mountains by men. Mining labor is abundant at from 50 to 75 cents per day, except about four weeks in June and July, when the feast of San Juan takes them all to the rivers to eat water-melons and petayee, a fruit of a species of the cactus. Masons, carpenters, and blacksmiths, such as they are, generally get from \$1 to \$2 per day. Drillers in the mine are paid by the hole, 12½ cents, a hole 16½ inches deep; they will work three 6 holes a day. Some of the best ones earn as high as \$9 per week, working two shifts.

The Poblador, an officer corresponding to our captain, is generally paid \$8 per week. You can see by these prices there is very little chance of foreigners competing in the labor market. They can't live without stealing and the natives monopolize that part of the business. I will hack all other nations on carrying an election; but when it comes to stealing ore or anything else that can be packed, I will bet my pile on the native, and give foreigners a discount.

Some companies here have brought stealing down to a minimum by commissioning the store-keepers to buy the stolen ore for their account, and then the company charge the amount to the watchman about the mine, *pro rata*.

Our mail facilities are some better since the Panama steamers touch at Mazatlan, and the country generally begins to feel a progressive influence, and if the changes made by the elections don't give her a backset there is some hope that she will come out in an age or two, at least with some

foreign help; for there is little hope of her working out her own salvation. When the man that is looked up to as the most progressive man of the time and most enterprising ranchero, owns a first-class flour mill and reaps 1,000 acres of wheat, with butcher knives and carries it to the stack in rawhide sacks, and uses a wooden mill to crush his sugar-cane with, with a steam engine and waterwheels standing idle alongside, he is a man far ahead of the age here in progress. They tried to make him Governor two years ago, but Pesquera was too heavy for him. Pesquera goes to Guaymas occasionally and the steamer-hoys have given him an idea how to manage elections so that progressive rancheros stand a poor show.

The rainy season has been a very wet one. The last year has been terrible on stock here. We had no rain from August to June of this year. Flour is worth \$18 per barrel, and everything in the grub line in the same proportion, but I must close this long letter which I know stands a good show to go into the scrap basket, but should anything of interest turn up in my rambles over this God-forsaken country, I will come again. RAMBLER.  
Alamo Estrado, Sonora, Mex., 1871.

### Mines in Siskiyou County.

EDITORS PRESS:—As a great deal of attention is being directed to the mines in this county, I take pleasure in contributing to your valuable mining journal some facts in regard to prospects in this vicinity.

Siskiyou county is very rich in gold deposits, and at the present time offers greater inducements for the investment of capital than almost any part of California. A year hence when the railroad is extended this far, the mines here will attract still greater notice.

In Yreka District, a body of Portuguese miners are doing well and get large returns for their labor. About Hawkinsville and Long Gulch and Canal Gulch, gold is found, and if properly drained, the whole country from Greenhorn to Hawkinsville, a distance of nine miles, would be worked to great advantage. A company is about to construct a tunnel to drain this district.

In Hnmhug District, nine miles from Yreka, the mines are more productive than in any other part of the county. Both the quartz lodes and placer diggings are paying well.

Messrs. Lash & Co. in the Eliza mine have an almost inexhaustible vein of ore which yields not less than \$16 per ton, and from that to \$25 and \$30 per ton. The vein is 7 feet wide, 90 feet below the lower level and there is no mine in the State from which ore can be more cheaply and easily extracted and reduced. It is thoroughly opened by a main shaft 300 feet deep, and by five different levels which run in on the vein, exposing large bodies of valuable ore, with rich sulphurets. They have also a fine 15 stamp quartz mill. With larger reduction works, and improved methods of concentrating the sulphurets, this mine would become one of the most profitable in the State, from the great extent of the vein, good ore and facilities for easily extracting and working it.

The Siskiyou county in the same locality is owned by a San Francisco company who propose erecting a large steam mill next spring. The Sbasta butte mine also pays well, and the placer diggings on Humbug Creek are yielding largely.

In Scott River district, Chinamen have taken out large quantities of gold dust and a number of hydraulics are kept in operation. A San Francisco company have been building ditches, and saw mills near Happy Camp, and will soon commence operations. One surface claim on Klamath is taking out about \$1,000 a week.

At Cottonwood the ledges prospect well, and at South Fork rich quartz ledges have been discovered and will be worked as soon as the miners can obtain means to erect the necessary machinery. In Scott Valley the mines are being worked by drifting and hydraulics. There are gold-producing basins in other parts of the county, but much remains to be done in tunneling the hills and river beds and in drainage.

Large streams well adapted for milling power are numerous, and the best of fuel

can be had for the cutting and hauling. The cost of milling ores is less in this county than almost any other part of the State.

When the Oregon and California Railroad which is being rapidly pushed forward and will pass directly through this region, is completed, this entire section from the extent and value of its mines and the facilities for cheap milling, is destined to become one of the most productive mining localities on the Pacific Coast.

O. E.

Yreka, Dec. 11th, 1871.

### Mechanical Hints.

#### Plastered Walls and Ceilings.

Particular care should be used in selection as to the strength and length of the hair to be used in the plaster for ceilings, and also as to the substance of the laths, which should in all cases be double. The plaster should be laid on with the minimum of thickness, a point much neglected.

With regard to the quality of the sand, it cannot be too good. Sand is apt to make the plaster too "short" only when there has been too much employed, and that with weak chalk lime. It is impossible that the admixture of loamy earth in any proportion can benefit any description of mortar or plaster, and therefore clean grit must be preferable to either pit or road sand, for loam in any shape is detrimental in proportion to its amount.

One word with regard to a possible substitute for hair, as hair is becoming every day more difficult to obtain. In the pulling down of portions of old work for the reparation of the Lollards' tower at Lambeth lately, some plaster of remarkable hardness was found. It was far superior to any of the rest, and upon examination was discovered to have been mixed with chopped rye straw (recognized by several of the heads which had been mixed up) instead of hair. This plaster was wonderfully sound and firm. Possibly other descriptions of straw might be found equally suitable for the purpose, and at any rate it would be quite worth while making some experiments on this subject.

Having obtained a really good plaster to work with, it is much to be wished that it might be applied in a somewhat more solid and durable manner than is usual, and that instead of flimsy laths nailed under the joists on each side of partitions to receive it, short pieces of wood were fixed in between the joists or quarters and the plaster trowelled on from front and back, so as completely to envelop these pieces of wood. By this means the plastering on partitions and ceilings would not be merely suspended coats, but the integral portions of the structure, which, when dry, would become most imperishable and incombustible. Thus, instead of being flimsy, interconnected things, inviting fire to destroy them, and the means of conducting that destroying element to all the other portions of the building, they would be, as it were, thin vertical or horizontal shields to prevent fire from spreading and touching the timbers. The use of plaster is, to a certain extent, common in Europe, and well deserves the attention of all architects.—*Scientific American*.

OLD CLOTHES.—Sneer not at old clothes; they are made by no lot and sacrifice; by careful folding-away, that they may last until the dear ones are provided for. If many an old coat could speak, what tales it would tell of the noble heart beating underneath. Yonder rusty garment would repeat the struggles of a devoted father whose son is earning laurels at the college, hard by. How he counted his farthings and choked down his pride, that his boy, his noble boy, might yet do him honor. That faded shawl, folded tightly over those spare shoulders. Year after year has the mother cleansed and mended and laid it carefully away (as she called it) "good and new," that her blue-eyed daughter might have an education. And the mother smiles over the dim, dusky-patterned ribbon and prime old merino, that were cleaned up to enable her to buy Bessie a pretty bonnet and a dress such as she deserved. Oh, that blessed self-denial of aspiring poverty! Hallowed be the old bonnets, old cloaks, old coats, aye, and old shoes, when such love points to them as monuments. More than one bright and shining light owes its brilliancy to old clothes; more than one star in literature, philosophy and science.

TO CLEAN LAMP-SHADES.—Lamp-shades may be cleansed with soap or pearlash; these will not injure or discolor them.

CORN starch makes the best paste for scrap-books.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**QUARTZ MILL.**—Monitor *Miner*, Dec. 16th: The Monitor & North Western mill is expected to be in readiness for crushing on New Years day.

### AMADOR COUNTY.

**THE NEW DISCOVERY.**—Jackson *Ledger*, Dec. 22d: The new discovery recently made in placer diggings near Drytown, will prove to be lasting and valuable. D. Worley, a few days ago sold one-third of the claim for \$1,000 and has since refused \$3,000 for the remainder.

### NAPA COUNTY.

**ST. HELENA.**—Napa *Republican*, Dec. 16th: From 3 to 5 large teams are loading daily with machinery for the Pope Valley Quicksilver Mines.

### NEVADA COUNTY.

**THE SITUATION.**—Grass Valley *Union*, Dec. 19th: The Erie mine is southwest from Grass Valley, on Deadman's Flat, near the head waters of Squirrel creek. There are 2 or 3 men working. The shaft is down 55 ft., on the incline. Three crushings have been made of rock which was taken out while sinking. The first one went \$111 to the load; the second \$145 and the third \$500. The rock in the ledge is looking well.

Gen. Grant is south from Grass Valley 4 or 5 miles. The ledge is improving as the miners go down. The last crushing gave \$85 to the ton. Drifts are being run on the ledge, while sinking is at the same time continued.

The John Bright mine is southeast from town near the Colfax road. Work in the way of sinking has been prosecuted with energy, and the shaft is down more than 200 ft. on the incline. The rock is looking very well.

Ben Franklin is near the Bright, and is being constantly worked. The shaft is down 60 or 70 ft. and pay rock has been taken out.

Greenhorn is 7 miles from Grass Valley. The shaft is down about 262 ft. on an incline. Sinking will continue until water prevents and then drifts will be run on the ledge. In the bottom of the shaft the ledge is about 5 ft. thick, showing free gold and heavy and rich sulphurets. On the dump pile there are about 500 tons of ore, which is waiting to be crushed.

Massachusetts Hill is idle with the exception of work on the Shanghai ledge, supposed to be a spur of the main ledge of the hill. The locations or claims of the Massachusetts Hill are as follows: Scadden Flat claims, now idle; Stockbridge claims, to the south of Scadden Flat, also idle, and on which there is a shaft only about 16 ft., deep; Massachusetts Hill Co.'s location, mill and underground works are idle; Rocky Bar claims, and known to be rich, Polkinghorne claims idle.

Black Lead south of Massachusetts Hill is regarded as valuable property. No work has been done upon it for several years.

Perrin's mine has good rock, estimated as being worth over \$80 to the load, by mill process. The ledge is strong and well defined.

South Star has been worked, up to within a few days, with good prospects of developing a fine mine. The ledge is a large one.

North Star is paying well and is being worked with a full complement of hands. The sulphurets from the rock are extremely rich.

Coe is being steadily worked. The shaft is down 350 ft. and a drift to the west is run 149 ft. The rock in the bottom is looking well, showing gold and heavy sulphurets. The ledge in the drift is of an average thickness of 3½ ft.

Eureka Mine prospects are most hopeful. For the last 12 days, only 20 stamps of the mill have been running. The clean up for the time is gold valued at \$22,000. In the lowest depths of the mine there is a steady improvement in the character of the rock.

**MONTANA LEDGE.**—Nevada *Transcript*, Dec. 16th: The owners of this mine have suspended work for a time, in order to have new hoisting works erected. The ledge is in Willow Valley, near this city. They have sunk down 112 ft., and run along about 450 ft. The ledge is about 10 inches in thickness and looks splendidly. The last crushing from the Montana yielded \$40 per ton, and it is the impres-

sion that the rock in sight will pay even more than that.

**NEW HOISTING WORKS.**—Kitts & Tully have just had new hoisting works erected on their mine—the Buckeye—at Willow Valley. Work was commenced about 2 weeks ago, and the Co. have a fine looking ledge of about 3½ ft. in thickness. They have let a contract for sinking. In the spring they intend to erect a mill.

**LOCATIONS.**—The Hope Gravel M. Co. have located 10 claims on Montezuma Hill, adjoining the mine of the Enterprise Co., in Bridgeport township.

McEambridge and others have located 600 ft. of ground in Omega Dist. at the head of Missouri Cañon and intend holding and working the same for mining purposes.

**ENTERPRISE.**—The Enterprise Co., working in gravel at Buena Vista Hill, 3 miles east from this place, is preparing for effective work. The Co. has purchased a steam engine to be used for hoisting and pumping purposes.

**HEUSTON HILL.**—At Heuston Hill mine 12 men are at work taking out rock. The last crushing paid \$180 to the load.

**GOOD QUARTZ.**—Nevada *Gazette*, Dec. 16th: Elleson, Nichols & Small, owners of a quartz claim on Selby Flat, have taken out a large amount of ore and are having the same crushed at Murchie's Mill, on Deer Creek. The rock is yielding \$30 per ton.

**DAISY HILL** is engaged in putting up machinery for hoisting and pumping purposes and the work of development is going on at the same time. Since the present Co. has worked the mine 175 loads of rock have been crushed. This rock gave \$11,395 worth of gold. The last crushing of 42 loads paid \$155 to the load. The rock in sight looks well.

**NEW YORK HILL.**—This mine has been leased by a party of working men. The mine is free of water and the miners are at work in it on the fourth level.

**KNIGHT OF MALTA.**—The ledge is 3 ft. in thickness, heavily charged with sulphurets and shows well in free gold.

**HEUSTON HILL.**—This mine is being worked with success, by parties who have a lease of the mine. The rock coming out shows well.

**GRAVEL MINES.**—The Hope, on Alta Hill, is the only mine in that locality at work. Altona has shut down for the present, and will remain so until heavier machinery is put on. The Altona struck into the old works of Alta No. 1, and hence the rush of water. Town Talk, to the east of town, is running ahead with the usual good results. The Enterprise, near Buena Vista Hill, is having steam machinery put up for hoisting purposes. The Enterprise has rich gravel in the shaft. The Webster is in a fair way to resume work at an early day; work is being done in washing over tailings and waste dirt. The Picayune is driving its tunnel ahead, and is in gravel which prospects well. The rains will make the Baltic commence work.

**OUTSIDE DIST.**—The Buchanan mine is about 3 miles above Nevada city. The owners are having a tunnel run into the hill, it is in about 150 ft., and in 30 ft. more it is expected that the ledge will be cut. This will give 120 ft. backs. The ledge is about 14 inches thick. The Buchanan paid \$152 to the ton.

The Erie mine in Eureka South is doing well. The shaft is down 200 ft.; this ledge is 27 ft. wide, between the walls, and the rock pays an average of \$12 to the ton.

**LOCATIONS.**—Nevada *Transcript*, Dec. 19th: W. Smith and others have located 1,200 ft. on a certain quartz ledge, on Independence Hill, in Grass Valley township, being an extension of the Independence mine. They have consolidated the same with ledges owned by Moran and others, under the name of the Consolidated Quartz M. Co., and they intend to open the ledges by means of a tunnel to a distance of 1,000 ft. from east to west, and 1,200 ft. from south to north, and beginning at the northeasterly boundary line of Independence tract.

The Stevens Co. have located 1,200 ft. on the Montes Bay ledge, on Gold Flat, Nevada township.

**PREPARATIONS.**—Grass Valley *Republican*, Dec. 19th: Ashburn & Baker, of Scotch Flat, are digging a ditch from the north fork of Deer creek to their hydraulic claims at Scotch Flat. They have completed 3 miles and have about 3 miles more to be finished.

**NORTH STAR.**—For a 10 days run there was cleaned up \$9,400.

### PLACER COUNTY.

**ST. PATRICK MINE.**—Auburn *Herald*, Dec. 22d: Work is steadily progressing with the most satisfactory results, and a large amount of rich rock is on the dump.

The new 15 stamp mill is completed and in operation on St. Patrick quartz.

**PETER WALTER MINE.**—The Co. have complete steam works on the mine, propelled by a 25 horse power engine, with friction gear and every thing working in most perfect order. The main shaft is down about 120 ft., and work is being prosecuted night and day with 3 shifts, 12 men in all working under ground. Levels are being run both east and west from the shaft at a point 116 ft. deep. These levels are in some 10 or 12 ft. and good ore, showing plenty of free gold, is being taken from them and hoisted to the surface. The value of the quartz taken from these drifts is placed at from \$40 to \$50 per ton. It is in contemplation, to erect a 10 stamp mill.

### SAN DIEGO COUNTY.

**BULLION.**—San Diego *Union*, Dec. 14th: There was shipped to S. F. by W. T. & Co.'s Express on the California, bullion amounting to \$1,165.

**BANNER DIST.**—A PRESS correspondent sends us the following:—Until the recent rains the quartz mills have been running with a scant supply of water, some of them using the same water several times, after settling it. The Ready Relief Co. are putting up a water-power mill. The pumping and hoisting works of the Redman mine are working satisfactorily, and good ore is being extracted. The Kentuck ledge is 18 inches wide; carries splendid rock. The Madden Co. have struck a large body of ore in the northwest drift which shows plenty of free gold. The Antelope ore is turning out better than it has for the past 6 months. Extensive improvements are being made in the mill of this company which will enable them to work some of the refractory ores of the district to more advantage.

## Nevada.

### COPE DISTRICT.

Drs. Marrotte and Reese have lately found a rich ledge near the St. Nicholas.

**TECOMA MINES.**—Carson *Register*, Dec. 13th: The milos are 5 miles from Tecoma, and a town is rapidly going up there. Buel & Bateman's furnace made a run of 32 hours, during which time it turned out 40 tons of bullion, carrying \$60 per ton in silver. There is an immense body of very rich ore in sight in the Buel mine. There are several other mines in the vicinity, particularly the Ironclads Nos. 1, 2, 3 and 4, equally as rich as the Buel, and the mountains are covered with prospectors and miners at work on promising ledges.

### EUREKA DISTRICT.

**MAGNOLIA Co.**—Eureka *Sentinel*, Dec. 15th: This Company is working the following mines: Newport Nos. 1 and 3 and the Astor mine. On the Newport No. 1 a shaft is down 54 ft. disclosing a ledge of fine milling ore, 7 ft. wide. Average samples of ore assay from \$70 to \$110 per ton. There is a commodious ore house over the shaft, 20x40 ft. in size, with a blacksmith shop attached. The Newport No. 3 is also vigorously worked, and an improved quality of ore has lately been struck. The Astor mine, a little south of the Newport series, is a recent purchase. Work has just been resumed in the old shaft, which is down 40 ft. showing a splendid body of high grade ore. It is the intention to continue the development of the mines all winter, and in spring either a mill or smelting works will be erected.

**FRIEBURG.**—Same paper, Dec. 16th:—Considerable work is going on in Frieburg Dist., Judge Goodwin has commenced the erection of extensive smelting works, and other improvements are also being made.

### ELY DISTRICT.

**BULLION.**—Pioche *Record*, Dec. 17th: W. F. & Co. shipped since Dec. 10th, for Meadow Valley Co., 67 bars of bullion, valued at \$87,488.11.

**BOWERY CONS. M. & M. Co.**—The trustees have already purchased and on the way here a No. 1 10-stamp mill, which will be erected as soon as possible at some point near Bullionville. As soon as the mill is erected, it will be steadily run upon ore from the Bowery mine. The Co. will add more stamps as soon as the main working shaft is sunk to the depth of 300 ft. Steam hoisting works will soon be placed on the mine at the main shaft, east of the old dump. The dump has over 300 tons of nicely assorted ore in it awaiting the mill.

**ALPS.**—Work in the lower level is being pushed ahead rapidly. We were shown specimens of ore yesterday from the 150 ft. level, which will assay up in the thousands. It is of chloride and will work well by mill process.

**PAGE AND PANACA M. Co.**—This claim is located on Panaca Flat, 700 ft. westerly

from the Discovery shaft of the Panaca claim, and from the appearance of the walls and the character of the material coming out of the shaft at a depth of 100 ft. it is evident the Co. will soon strike good ore.

### HUMBOLDT.

**ARIZONA CONS.**—Unionville *Silver State*, Dec. 23d: During the last month or two the mine has been steadily improving. The south incline is down 125 ft. and the ledge is 4 ft. thick at its deepest point, and contains a fair proportion of shipping ore. The milling ore which remains after selecting the shipping ore, assays about \$65 to the ton. There are 4 other shafts or inclines being sunk from the main lead, in all of which fine bodies of ore are found running, from 2 to 7 ft. in thickness, with more shipping ore in sight than has ever been exposed in the mine at any one time before, since it was opened. On the second level this Co. has about 700 ft. lineal measure, of ledge exposed, with apparently unlimited depth. The upper stopes have greatly improved of late, and on the whole the mine never looked so well as at this time.

**EOLIPSE.**—The owners of this mine are driving ahead with their work. They have a quantity of ore at the Pioneer mill, being worked.

**PERU.**—Work on this mine goes on with increasing strength and body of vein matter.

**INSKEEP.**—The Inskeep mine is producing considerable quantities of good ore; a large percentage of which is shipping ore.

**SHEBA.**—Work is still being pushed upon this mine. They are taking out considerable quantities of shipping ore, and a very large amount of milling ore which assays from \$80 to \$120 per ton.

**DE SOTO.**—Work is again commenced on this mine.

### REESE RIVER.

**SARATOGA MINE.**—Reese River *Reveille*, Dec. 15th: The incline is down 320 ft., the ore house full of rich ore and the mine looking better every day. The Props. have 4 men at work and are taking out an average of \$400 every day.

**METACON MILL.**—Same paper, Dec. 19th: We saw to-day at the banking house of Paxson & Co., 10 bars of bullion from the Metacoon Mill, valued at \$7,464.85, and weighing 10,301 ozs., the result of about two weeks run. (day time only,) from ore from the Pacific M. Co's mine, on Lander Hill.

**CROWN POINT.**—Virginia *Enterprise*, Dec. 17th: The Nov. receipts from this mine footed up \$234,797. The assays of ore at the 900-ft. level average \$50 per ton, and at the 1,200-ft. level, \$110 per ton.

**HALE & NORCROSS.**—The receipts of bullion from the Hale & Norcross for Nov. amounted to \$6,176.

The main incline in this mine is sunk 100 ft. below the lowest level. This work is being pushed vigorously, and 4 ft. is the average daily progress. So soon as a perpendicular depth of 100 ft. shall have been attained the ninth level will be opened. Important developments may be looked for on the Virginia end of the Comstock within a very short time, as the Hale and Norcross, Savage and Ophir will soon open new levels.

**SUTRO TUNNEL.**—The Sutro Tunnel was yesterday in a distance of 2,620 ft. Work will be commenced on all the shafts next Tuesday.

**MILLS SHUT DOWN.**—Owing to the flood nearly all the mills on Carson river have been temporarily shut down.

## Colorado.

**MR. BROSS.**—Cor. Central *Register*, Dec. 6th: Far above the timber line is the Tar Heels mine carrying a vein of very rich ore, about 10 inches in width, principally sulphurets of silver.

Next in valuation is the Baker. An open cut on the vein 15 to 18 ft. in length, disclosed a vein of ore 18 to 20 inches in thickness. Carbonate of copper, sulphurets of silver, with a small percentage of galena, compared with the amount of copper, are present in the ore.

Near the Baker is the Moose. The vein of ore is very rich in silver. It is the only mine that is being worked the present winter. The Northern Star, a short distance below, promises well. East of the Northern Star is the Dwight.

A number of discoveries, some of them quite rich have been made on Mount Lincoln.

**CALIFORNIA GULCH.**—Cor. same: It has been estimated that since the discovery of gold in Colorado, California Gulch has produced over two and a half millions in gold dust.

There are at present below Granite on the Arkansas 40 or 50 men employed in

"rocking" dirt, that are making from \$2.50 to \$8 per day.

The Printer Boy, Pilot, Five-Twenty, American Flag, and Berry Tunnel, are the main objects of attention. In the Printer Boy a shaft has been sunk 100 ft. and a boundary shaft 78 ft. deep. Between the two shafts a level has been run 450 ft. over which is a slope of ground 60 ft., in depth. 145 cords of ore from this slope, treated at the Five-Twenty mill, gave an average yield of 18 ozs. per cord. At the time of my visit, the mill (one battery) was running on wall rock that yielded from 3 to 6 ozs., per cord. This winter the mining foreman, intends sinking the main shaft 100 ft., deeper, making it 240 ft., in depth, and then drift north 450 ft., to the boundary shaft, making a slope of ground 100 ft., in depth, and 450 ft., in length.

Two main houses have been built during the past season.

WARD same paper Dec. 15th: The Mohawk lode is leased to an English Co., and the development of the mine will be immediately commenced.

WORK is being resumed on the Ompjett lode in Mountain city. With the reduced rates of treating ores, the prospects are quite flattering.

### Idaho.

RICH QUARTZ.—Idaho World, Dec. 16th.—On Last Tuesday J. Good took 7 lbs. of quartz from his ledge at Granite creek, and after pounding it in a mortar, panned out \$1.75 which assayed gave at the rate of \$475.15 per ton.

ROCKY BAR.—Boise Statesman, Dec. 14th: The Red Warrior mill has shut down for the winter. The mill has been doing well in the latter clean ups made. The one before the last yielded \$50 per ton for the rock crushed. From Atlanta, the report is that Mr. Mattingly is starting up his mill with new pans, and will run all winter. Considerable ore will be taken out on the dump this winter in that region.

MINING RECORD.—Owyhee Avalanche, Dec. 9th: At the north discovery of the Oro Fino, several hundred tons of ore are piled up on the yard ready for transportation to the mill. They are taking out about 25 tons daily. Both the ore house and shutes are full of ore taken from the north end of the south discovery.

The Little Giant, about 50 ft. east of the Oro Fino, is being worked at 3 points, viz.: A crosscut run from the Oro Fino tunnel, sinking the main shaft and stopping in a tunnel driven in from the surface.

At the south end of the South Oro Fino Discovery we found on the yard over a hundred tons of fine looking ore. A drift is in from the surface 160 ft., with stopes following it up. At this point a shaft is down about 75 ft. on the ledge, which is from 2 to 3 ft. wide, both in shaft and drift.

In the Ida Elmore, the vein in both the 6th and 7th levels is improving. The Supt. informs us that he intends soon to commence sinking the main shaft in order to strike the rich body of ore lately discovered in the 8th level of the Golden Chariot, only 100 ft. below the bottom of the Elmore shaft.

In the Golden Chariot, so far as is yet known, the recent strikes in both the 5th and 8th levels are rich and extensive. Additional hands have been put to work, drifts have been started and the 7th level will immediately be connected. The depth of the 8th level is 690 ft.

### Montana.

BEEVILLE.—Cor. Helena Gazette, Dec 16th: We are on the southern fork of Clancy creek, about 5 miles west of Jefferson City and about 20 miles south from Helena. Our lodes are the Compromise, lying idle from causes unknown to the writer; next, is a discovery on the Gregory worked by Sanders & Co., who are working six men and have out about 60 tons of ore. The next is the Mineral Hill worked by Wood Parker & Co., who have 2 men sinking through a cap. They will commence on Monday to hoist ore. Next is the El Dorado. This mine has 5 men employed, and have out on their dump about 100 tons of fine ore. Next is the Self Supporter, owned by Halford & Co. who have a shaft down 50 ft. with some Galena in sight but not in paying quantities—prospect flattering. Next is the Poor Man, with a shaft down 25 ft. It prospects good for a fine lode. The last is the Minnesota. There are 5 men at work on this lode, taking out ore. There have been several discoveries made recently, some very promising.

PHILLIPSBURG.—Deer Lodge Independent Dec. 9th: Mr. Cameron is pushing matters at his mine. He has struck a mass of iron rock in his drift that renders progress very slow. It is believed to be the casing of

the ledge. A number of men are engaged in taking ore from the upper level in the mine and have about 100 tons of fine ore out.

A number of miners are engaged on Upper Ophir in drifting out pay dirt.

### Utah.

BULLION.—S. L. Tribune, Dec. 16th: W. F. & Co. forwarded yesterday to New York 16 bars of fine bullion from the Raymond & Ely Works, Pioche, worth \$50,373.32. On the 20th they shipped to N. Y. 7 bars, worth \$7,853.21, from the Meadow Valley mine.

PROMISING.—The Vespasian has widened to 2 ft. of rich ore, which gives an average assay of \$200 to the ton.

WEST TINTIC.—The Pacific M. Co. are enjoying fine prospects. This Co. has 7 lodes, varying in width from 3 to 7 ft., and the ore assaying from \$50 to \$200.

Work is being pushed on most of these claims, and the prospects are that they will develop into good mines.

COLUMBIA DIST.—There will be 5 or 6 Cos. at work on as many different ledges all winter, and by the opening of spring will determine the true merits of this camp. All the ledges that have been opened are looking exceedingly well.

The Gold Eagle Co. will commence shipping ore in a few days to Ophir city.

The Washington Co. have resumed work again upon their mine with flattering prospects. The ledge is 5 ft. wide, with pay ore from the surface and improving as they go down upon it. Prospecting is suspended for the winter.

OPHIR AND MR. LION MINE.—From the original discovery hole I could trace the vein by the rich chloride ore, that is left for that purpose, to the Webster shaft, some 250 ft. On descending this shaft 70 ft., I came to the first level, where I found a well defined ledge of first class ore, at least 6 ft. thick. The Webster shaft continues down to a depth of 100 ft. and is run straight, regardless of the pitches and angles of the vein. I next visited the Mormon Belle shaft; on descending about 40 ft. I entered a drift running northerly, which I followed to the Blue Wing shaft, No. 1; and thence to Blue Wing shaft No. 2. "On my return I examined the ore vein, and I am sure that it is a true fissure vein, that contains very rich ore.

The drift mentioned, connecting the several shafts, was run on the course, and following the vein, to trace out as many locators. The Blue Wing shaft, No. 2, is at a depth of 80 ft., showing a good vein of yellow chloride ore; at present this shaft is being used as the main channel for perpendicular development. Sinking is rapidly being pushed forward, following the vein. The lumps accumulated from this shaft show some exceedingly rich ore.

In the Silver Exchange, just below the above described mine, I found a tunnel 40 ft. long, tapping this mine at right angles. A shaft at the end of the tunnel following the rim down to a depth of 60 ft., and a drift 30 ft. each way on the course of the vein, showing a crevice of ore matter from three to four ft. wide, that will sample from \$300 to \$500. There are about 50 tons of high grade ore on the dumps awaiting shipment.

On my arrival in Ophir, I found much excitement over the development of the Chance (Swansea) mine. It has opened out to 6 ft. of solid ore, and assays very rich.

Jacobs & Co. and the Omaha Co. of Dry Cañon, are working large forces of men. Simon & Co., of East Cañon, are pushing their mining operations vigorously. The Walker furnace is progressing finely.

DRY CANON.—Cor. S. L. Review, Dec. 15th: In the Balsam mine on the west side of Treasure Hill, about 100 or 125 yards from the main road, a tunnel has been run about 30 ft., showing a vein of galena and carbonate the width of the shaft, and very fine smelting ore. The Co. are building a chute from the mine to the road, a distance of about 400 ft. Croppings on the surface can be traced for a long distance east and west. They have located a tunnel site on the same ledge, called the Nahoh, with the intention of tapping the main ledge 100 ft. below.

On Shoo-Fly Hill, the owners of the Iris have erected over the entrance of the incline a substantial ore-house, with a track passing through it into the mine. The depth of the mine is 130 ft., and a drift of about 50 ft., showing an immense body of milling ore.

The Alabama mine is about 500 ft. south of the Iris; it has a shaft of 40 ft. in depth, showing a fine body of milling ore. The Dry Pine is about 600 ft. southeast of the Alabama. The ore extracted from this mine, is of the highest grade galena, assaying, on an average, \$100 to \$125.

### San Francisco Mining Stock Market.

THURSDAY EVE., Dec. 28, 1871.

Stocks have been active during the week. No meeting of the Board was held on Christmas. The following telegram was received Dec. 22d from the Superintendent of the North Star Mine, Grass Valley: "Shipped \$9,400. Everything all right; running smoothly."

The aggregated sales of the Stock Board from Dec. 14th to Dec. 20th were \$2,390,962.

For the past week, only 174 tons of ore were received from the Chollar-Potosi Mine, assaying \$36.40 per ton. Up to the 26th \$75,000 had been received on December account, from the Meadow Valley Mine. The Raymond & Ely was shut down 36 hours during the week for repairs to boiler. Last week 700 tons of ore were taken from the Hale & Norcross Mine, and 1,000 tons from the Savage, the latter assaying \$27.20 per ton.

At the annual meeting of the stockholders of the Ophir Silver Mining Co., held Dec. 20th, the following Trustees were elected: M. Castle, L. L. Robinson, Judah Baker, Jr., A. Block, F. Logan, R. Hochkoffer and Geo. Shultz. Subsequently the Board organized and elected the following officers: Michael Castle, President; L. L. Robinson, Vice-President; Joseph Marks, Secretary; Philip Deidesheimer, Superintendent; Bank of California, Treasurer. During the year ending Dec. 20th, the total receipts of the Company amounted to \$188,046.34; total disbursements, \$175,142; leaving cash on hand, \$2,904.26.

### New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

GREENE MINING Co.—Capital stock \$600,000, 10,000 shares. Trustees: W. G. Greene, A. C. Peachy, F. Peach, W. L. Higgins, and W. Bryan.

SILVER PEAK MINING Co.—Capital stock \$2,000,000, in 20,000 shares. Trustees: J. D. Fry, J. M. Martin, W. Chine, W. H. Sears and L. G. Hoyt.

HOMEOPATHIC HOSPITAL AND COLLEGE.—J. Chnsing, F. Geary, J. A. A. Weston, S. Beakley, and J. A. Eckel.

MUTUAL PROTECT ASSOCIATION OF SAN FRANCISCO.—Trustees: T. Anderson, J. C. Mitchell, H. W. Jones, T. Housworth, R. Irwin, G. H. Mitchell, J. C. A. Hill, J. L. Fields, W. Bank and S. S. Pomroy.

The following have filed certificates in the Secretary of State's office, Sacramento:

NORTH PACIFIC RAILROAD Co.—S. McMillan, Shafter, Pres; H. B. Platt, Vice-Pres; W. H. Tilghast, Treas; G. W. Morgan, Sec; J. T. Boyd, Attorney. Directors: W. H. Tilghast, J. McMillan, H. B. Platt, A. D. Moore, J. T. Boyd, W. H. Ladd, T. Curtis, S. R. Throckmorton, C. Webb Howard, J. P. Moore, L. Gastle, S. P. Taylor and W. F. Russell. Capital stock \$1,500,000.

SACRAMENTO SILVER MINING Co.—Capital stock, \$500,000, in 5,000 shares. Trustees: W. F. Edgar, A. J. Johnson, H. M. Smith, J. C. Udall and J. G. Howard.

"DEVIL'S ELBOW TUNNEL, FLUME AND MINING Co."—Capital stock, \$160,000, in 1,600 shares. Trustees: J. F. Woods, J. R. McVay, W. Fern, J. L. Denison and E. S. Denison.

SACRAMENTO LIBRARY ASSOCIATION.—Trustees: T. Baker, N. Walters, W. H. Porter, J. W. Pew, C. A. Grow, F. H. McCormick, F. C. Ross, S. C. Seville and F. Miller.

OPHIR COPPER SILVER AND GOLD MINING Co., have filed a certificate of the increase of the capital stock from \$370,000 to \$1,000,000.

REVENUE SILVER MINING Co. Capital stock, \$1,000,000 in 10,000 shares. Trustees: S. B. Edwards, J. G. Edwards, and H. McPherson.

IMPROVED STILL Co. Capital stock, \$1,000,000, in 10,000 shares. Trustees: G. Johnson, W. Neil, and J. Gavley.

EQUITABLE TUNNEL AND MINING Co. Capital stock, \$1,000,000, in 40,000 shares. Trustees: W. Fenton, J. C. Parks, E. Hutchinson, W. G. Wayman, C. S. Healy, J. P. Nesmith, and G. T. Emery.

SCANDINAVIAN HALL ASSOCIATION. Capital stock, \$75,000, in 6,250 shares. Trustees: G. O'Hara Taaffe, O. W. King, T. Thomsen, J. Nelson, H. L. Lendstrom, W. Lundberg, E. A. Brandt, J. G. Nelson and C. Christiansen.

STUMT MINING Co. Capital stock, \$300,000, in 3,000 shares. Trustees: H. McAllister, S. Hermann and J. A. Osgood.

GULF OF CALIFORNIA COMMERCIAL Co. Capital stock, \$600,000, in 6,000 shares. Trustees: A. Kyle Macsorley, J. Schreier, W. G. Badger, W. Mocker and W. S. Brown.

The following have filed articles of incorporation in the Secretary of States' office, Sacramento:

BOCA WOOD AND LUMBERING Co. Capital stock \$75,000, in shares of \$100 each. Trustees: L. E. Doane, W. E. Terry and S. B. Elwell.

THE STORM, which commenced a week ago, last Sunday night, has continued, with slight interruptions, to the present time, Thursday afternoon. The amount of fall in this city up to this time, has been over 14 inches for the present storm, and about 18 1/2 for the season.

BEEF PACKING.—Latterly this business has been transferred to the State of Kansas in the neighborhood of vast plains of pasture lying within and near the borders of that State.

### IMPORTANT PATENT DECISION.

We give below the decision in full of the Examiners-in-Chief in the United States Patent Office, on an interference between John A. T. Overend and William Wallace Dunn, both of San Francisco, Cal., both of whom claim to be the inventor of an Improved Type-casting, Breaking, Rubbing and Setting Machine, for which both have made application for Letters Patent. This case has attracted considerable attention from the mechanics of San Francisco, on account of the peculiar nature of the conflicting claims. The decision given is a plain, fair, and, in our opinion, unbiased statement of the facts as proven and given to the Patent Office.

JOHN A. T. OVEREND  
vs.  
WM. A. DUNN.

Type Machine.

Dunn filed application May 17, 1870.  
Overend filed application Oct. 5, 1870.  
Notwithstanding this pending application, a patent was issued to Dunn, January 24, 1871.

On the 1st of February Overend's second claim was rejected on reference to Dunn's patent, "in which, substantially, the same devices are shown, but not claimed."

An interference was then demanded and granted.

The second claim of Overend is as follows: "The sliding plate, N, arranged as described, so as to carry the type between the rubbers, P, P, in combination with the carrier I, clamp L and table K, constructed and operated as described."

Overend made the preliminary statement required by the rules.

Dunn neglected to do so, and relies therefore upon the date of his application, May 17, 1871, as that of his invention.

The statement of Overend shows him to have been the inventor of what he sets forth in his second claim long before that time. His evidence substantiates and establishes the same thing.

It must be borne in mind that he does not claim all that is shown and claimed by Dunn, but only what appears in his own device.

Dunn's machine appears very complicated, and with very many parts and arrangements not in Overend's. Overend's machine, on the contrary, is very simple.

The question to be decided, therefore, is, whether he invented what he thus claims before the 17th of May, 1870?

Dunn has introduced testimony to show that he is the sole inventor of the devices claimed, and that Overend derived them wholly from him, and is no inventor. But he depends almost wholly on his own unsupported averments to sustain this. He claims that in the fore part of 1869 he applied to Overend to assist him with funds to get up and bring out the type machine, and offered him an interest; and that Overend said it would be time enough to settle the matter of interest after the success of the invention had been established, but went on and procured patterns and castings for frame and bed-plate and furnace, etc., for the machine, which castings were taken to one Garcia to be set up and fitted, etc.; that sometime in March he (Dunn) took the partly completed machine from Garcia's to his own house, where he worked on it for a time, and then, in the summer of 1869, removed it to his shop in the Vulcan Foundry, where he continued to work upon it until he completed it, in February, 1870.

But Dunn on his cross-examination admits that Overend's name appeared on the patterns and frame of the machine, and his initial also on other parts, but "merely as a complement;" and that Overend paid all the bills and expenses, amounting to \$400, except a trifling express matter, but never paid him anything for his services. He denies that Overend ever made any valuable suggestions to him, or set up any claims to the invention until they had a falling out about the time the invention was completed, when he says Overend made application to a patent attorney to caveat or patent it; that he ascertained this fact about the middle of March, 1870, and he went immediately forward to make application himself.

Several witnesses engaged about the Vulcan Foundry, and who saw Dunn at work on the machine after it came there, give their opinions that he was the inventor from the fact that he made so many changes and alterations, and was apparently working without aid or advice from any one.

One West goes beyond all the others,

even Dunn himself, and swears to seeing models of the type machine in 1866, and describes a nearly completed machine; and that Dunn concluded, in the fall of that year, to adopt the armed spider to receive and place the type on the rubber, which is a portion of the device now in controversy. He also says that he saw Dunn making a large machine at the Vulcan Foundry in 1868, when no machine was commenced until 1869. But little dependence can therefore be put on this witness.

On the other hand, Overend claims that he had fully conceived of the devices in controversy, and designed introducing them into a machine, and disclosed his designs to Dunn and others; that he is an old type-founder, and had devised some of the parts in dispute many years ago. That he got up patterns and castings on his own motion, and at his own cost and expense, to carry out his invention, and employed Garcia to work upon it. That Dunn was also in his employ in a printing office. That when Garcia had partially completed the machine, Dunn represented that there was danger of his appropriating the invention, and had, in fact, made propositions to go and manufacture it as he, Overend, had no patent, and therefore argued that it should be taken from Garcia and entrusted to him, (Dunn), who would take it to his house, and there complete it, in consideration of Overend's service on another machine which Dunn was getting up. That the partially completed machine was thereupon taken from Garcia, and turned over to Dunn. That he fully described his improvements to Dunn, and from time to time gave directions and instructions; and that the bills were all paid by him, amounting to \$800, besides an additional allowance made for Dunn's services. That when the machine was finished, Dunn told him to take it away, but when he sent for it, refused to let it go.

What the nature of the quarrel was between the parties at this time does not appear. Now Overend's testimony is, itself, sufficient to show that he was an inventor of the things claimed before Dunn made application, whatever Dunn may have been, or whatever he may have done before that time.

But the evidence of Garcia is perfectly conclusive on the subject. He shows that the whole thing was fully disclosed and described by Overend, and that he could have gone on and completed the machine under his instructions, had it not been taken away.

Other witnesses show most satisfactorily that Overend had devised the improvements claimed, and employed Garcia and Dunn as simple mechanics to put them in form.

There were evidently many valuable mechanical changes and arrangements made by Dunn, but we are satisfied that he received all of the important ideas from Overend, and that he would never have attempted to bring out the machine had it not been started by Overend.

It is perfectly incredible that Overend should have advanced all the money and given so much of his time and attention to bring out this invention unless he believed that he had some right in it beyond the mere verbal promise of Dunn that he should have an interest. It is incredible that his name should have been put on the machine merely as a compliment.

The whole history of this case, with its surroundings, show at least that Overend supposed that he was the inventor and that Garcia and Dunn were only mechanics employed to work out his invention. The evidence in the case also satisfies our minds that Garcia so understood, and so continued to understand; and that Dunn acted on such understanding up to the time of the quarrel after the completion of the machine.

We must, therefore, reverse the decision of the Examiner of Interferences and award priority of invention to Overend.

RUFUS L. B. CLARKE,  
S. H. HODGES,  
J. M. THATCHER,  
Examiners-in-Chief.

**THE WONDERS OF PHOTOGRAPHY.**—The exigencies of the Parisian siege have brought prominently before us the use of micro-photography. A writer in the British *Journal of Photography* predicts that we will soon have our daily paper handed to us the size of a postage stamp, and carry our favorite poets in our vest buttons. We will see "a new edition of Macaulay's complete in three shirt-studs," or "the city edition of Dickens" complete in two sleeve-buttons. Every one will then carry a microscope as we do now a penknife.

### THE MOUNTAIN GOAT.

We give herewith a pictorial representation of what is generally known, in the mountains to the east of the Sierra Nevada, as the "Mountain Goat," although it is sometimes called the Ibex; but the photograph from which our engraving has been prepared differs so widely in appearance from the Mountain Goat—*Aploderus Montanus*—as figured in *Zell's Encyclopedia*, that we are inclined to believe that the animal here shown is a different variety.

The animal here represented was captured by Messrs. Palmer & Barker, of Deer Lodge, Montana. The photograph was procured by our agent. Judging from the picture of the animal, which is a faithful copy from the photograph, he must be a fierce looking old fellow. Indeed, he is said to be the largest of the species ever taken alive. He stands three feet five inches high, and after three weeks of captivity, during which he was left six

days, at one time, without food, he weighed 250 pounds. His weight when captured must have exceeded 300 pounds.

The animal made a gallant fight with the dogs, and severely wounded one of them, but was finally lassoed. The wool of the Mountain Goat is four or five inches in length, perfectly white, and of a very fine, silky texture; but is pronounced by our wool manufacturers unfit for their purposes.

The manner of the pursuit and capture of these animals is described by the *Deer Lodge Independent* as follows: "They are shy, fleet, and leap from crag to crag sure-footed and fearlessly; but they grow tired and become combative by and by and so are caught in this wise: The bounds start and follow them, and for the time the race is to the swift. But perseverance conquers. Chased for miles they come to bay upon some cliff where the dogs can only come at them one way. While thus engaged the hunters circle off, climb the rocks above them and dropping a lasso dexterously, down it falls around the neck of the animal and strong arms hoist him to the realms above. This method of capturing seems hardly credible, and may remind some people of the story in McGuffey's readers of the Natural Bridge adventure, but its just as true as anything. Some of the captives are young and are becoming quite domesticated already."

### Washing Horses' Legs.

The use of water in washing horses' legs is quite too often very much abused. Without care, nothing produces more inconvenience. In many places the blessings of pure water have been extolled and received as a cure almost for everything, and, acting upon the belief, the converts imagine that they cannot have too much of a good thing. Results are, however, against the supposition. The evil consequences of an improper washing of horses' legs are cracked heels, swelled legs, greasy heels, etc., all of which may be avoided in ninety-five cases out of a hundred.

In many stables visited by the writer the horses, when returning from work, whether cold or warm, tired or hungry, are compelled to stand some minutes, while each leg, almost to the middle of the body, is either washed with very dirty water, or drenched with very cold water from a hose. On many occasions horses have to be thrown off work, in consequence of internal disease arising from such practice. Carriage and hack-horses suffer much from cracked heels, while their breed defends them, frequently, from grease. All this comes from the treatment to which they are subjected.

To the mere washing of horses' legs, if conducted properly, no one can offer objection. In wet, dirty weather, when the hair is matted with mud, no animal can rest comfortably with such an accumulation about him. If allowed

to remain, the sand and grit is moved during exercise to the wrinkles of the skin about the joints, and the parts are chafed, soon becoming raw, and presenting obstinate sores. By all means, let the filth be removed as quickly as possible, using clean water from a bucket. A good sponge and brush, with a small quantity of soap, will also be required.

Next press out the superfluous water and briskly rub with coarse towels, kept for the purpose; and put loosely a bandage upon each leg, as high as the parts have been washed, which should scarcely ever be above the knees or hocks. This process will very certainly limit the number of cases of cracked heels, grease, etc., all of which occur from the amount of cooing to which these parts are exposed when wet.

We frequently hear, in stables, the directions given to "be sure and rub the legs dry." Whoever gives such instructions cannot be aware of the almost impossibility of that which they require, unless men and horses are entirely deprived of rest. The easiest and most economical method is the use of flannel or linen bandages. By their use the legs dry rapidly through the means of natural heat, and in this way the groom will generally be enabled to remove them, and rub down the legs before leaving for the night.

### Agassiz's Expedition.

In speaking of the expedition of Professor Agassiz to the Southern Ocean, the *Engineering and Mining Journal* says:—Among the questions to be determined by this expedition are the temperature and percentage of salt which the sea contains at different depths.

The latter question would be difficult to solve on shipboard by any analytical process in use, and therefore recourse has been had to an exceedingly simple and ingenious method. The density of water increases, within certain limits, in exact proportion to the amount of salt which it contains, and therefore accurate determinations of its specific gravity would show how much salt it contains. Accurate results are, however, not so easily had, even with very delicate hydrometers, on an unsteady vessel, and hence it is proposed to ascertain the density of the water by means of its varying index of refraction. A hollow glass prism is so mounted as to form an apparatus that can be held in the hand like a sextant, and by which the angle of refraction can be measured. If this prism be filled with sea-water of different densities, a ray of light passing through it will be refracted at different angles. The determination of this angle will furnish a means of determining the amount of salt contained in the water.

The temperature at different depths will be determined by self-registering thermometers, and it is, we believe, proposed to employ also an apparatus invented by Mr. Siemens for determining high temperatures. It is based on the principle that the resistance that a galvanic current encounters in passing through a coil of wire, increases with the temperature of the wire, other conditions being the same.

An apparatus has been constructed by means of which it is hoped that the depth to which the light of the sun penetrates beneath the surface of the ocean may be determined. By means of clock-work, a photographic plate is exposed for a given time, after having been sunk to any desired depth, and again covered up. It can then be drawn up to the surface and examined, in the usual way, in order to discover whether it has been at all exposed to light, and if so, the relative intensity of the light. Another apparatus has been constructed so that the clock-work will run evenly and well in water or glycerine, with which the containing box will be filled, in order to resist extreme pressure at very great depths.

### Important Decision.

Farmers, especially, will be interested in the following decision not long since decided in the Supreme Court, in reference to mortgages on growing crops: Williston had a mortgage on a crop of wheat grown by McGrane, who cut the wheat about the 20th July, and on the 10th August sold it while in stacks and shocks in the field to Goodyear. Five days afterward, Williston came along and took possession of the wheat under his mortgage. Goodyear brought suit and recovered judgment, and the Supreme Court affirmed the judgment on appeal. The moral is, that if you take a mortgage on a growing crop, you must not wait for three weeks after harvest to take possession, but you must be on hand without delay. The record of the mortgage is protection before the grain is cut, but, after cutting, the general rule applies that the mortgagee of personal property is not safe unless he is in possession.

## USEFUL INFORMATION.

## Taking Off Hides.

Being a worker in the leather manufacture, I have constantly under my notice the awkward manner in which the farming community take off the hides of animals of their own slaughter. The hind leg, for instance, being slit up along the inner, or, perhaps, inner side, so as to leave the hock of the hide in the form of a scull cap. As upon being brought into work, every part must be made to lie flat, this portion has to be opened by cutting unsightly strips, which materially impair its usefulness.

The following directions may assist the novice in performing the operation:

We will suppose the animal dead and placed on its back; the operator, by thrusting his knife point foremost and edge up, makes a slit the entire length of the carcass, from the chin over the center of the breast in the line of the navel to the vent. Let him now stand by its side, with his face looking the way the head lies, and taking the forefoot in his left hand, run the point of his knife in the line of the cleft of the foot and cap of the knee, up the front of the leg and into the central slit of the bosom. For the hind leg, having reversed his position, let the slit be made in the line of the heel, over the center of the cap of the hock, down the back of the ham into the central slit. In this way the hides when spread out will have a square form without long projections, and consequent deep indentations of its outline.—*Cor. Canada Farmer.*

**CURIOSITIES OF CHEMICAL SCIENCE.**—An atom of water sometimes makes a most extraordinary difference in the properties of bodies. Thus, to give some more familiar illustration, the addition of an atom of water to starch converts it into sugar; the subtraction of an atom of water from alcohol converts it into ether. But perhaps the most curious change produced by the removal of an atom of water from a body has been recently discovered by Dr. Matthieson of London. Morphia, the well-known active principle of opium, is commonly used to allay vomiting, and very often performs the duty very effectually. But when morphia has been heated with hydrochloric acid, and an atom of water has been thereby removed, it is changed into the most active emetic known. It is not necessary to swallow it to produce the effect; a very small quantity introduced under the skin, or even, it seems, split upon the hand, is quite sufficient to produce vomiting, which, however, soon subsides, and leaves no nausea afterwards. The new body introduced into medicine has been named by its discoverer Ememorphia.

**RUSTING OF IRON.**—Dr. Calvert has communicated some very useful information on the rusting of iron. Rust is mainly sesquioxide of iron, and it has always been supposed that the active agents in producing it are moisture and oxygen. It seems, however, from Dr. Calvert's experiments that carbonic acid must be associated with these to produce any considerable amount of oxidation. In dry oxygen iron does not rust at all; in moist oxygen but little and seldom; but in a mixture of moist carbonic acid and oxygen, iron and steel rust very rapidly. In like manner a piece of bright iron placed in water saturated with oxygen rusts very little; but if carbonic acid is present as well, oxidation goes on so fast that a dark precipitate is produced in a short time. Curiously enough, bright iron placed in a solution of caustic or carbonated alkali does not rust at all. These facts show that the points to be attended to in the preservation of iron from rust are exclusion of carbonic acid and moisture, two indications which may be very easily fulfilled.

The relative value of gold and silver in the days of the patriarch Abraham was 1 to 8; at the period B. C. 1000, it was 1 to 12; B. C. 500, it was 1 to 13; at the commencement of the Christian Era, it was 1 to 9; A. D. 500, it was 1 to 18; A. D. 1100, it was 1 to 8; A. D. 1400, it was 1 to 11; A. D. 1613, it was 1 to 15½; which latter ratio, with but slight variation, it has maintained to the present day.

**IRON SPONGE,** which is coming into important use as a disinfectant and powerful absorbent of noxious gases, also a filtering agent superior even, it is said, to animal charcoal, is manufactured by calcining a mixture of iron ore and charcoal finely pulverized.

## Useful Hints.

Why are some things of one color and some another? As every ray of light is composed of all the colors of the rainbow, some things reflect one of these colors and some another.

Why do some things reflect one color and some another? Because the surface is differently constructed, both physically and chemically, and therefore some things reflect one ray, some two rays and some none.

Why is a rose red? Because the surface of a rose absorbs the blue and yellow rays of light, and reflects only the red ones.

Why is a violet blue? Because the surface of the violet absorbs the red and yellow rays of the sun and reflects the blue only.

Why are some things black? Because they absorb all the rays of the light and reflect none.

Why are some things white? Because they absorb none of the rays of light, but reflect them all.

What is the cause of the wind? The sun heats the earth, the earth heats the air resting upon it; as the warm air ascends the void is filled up with a rush of cold air to the place, and this rush of air we call wind.

Why does the black skin of the negro never scorch or blister, with the sun? Because the black color absorbs the heat, conveys it below the surface of the skin, and converts it into sensible heat and perspiration.

Why does a drop of water sometimes roll along a piece of hot iron without leaving the least trace?—Because (when the iron is very hot indeed) the bottom of the drop is turned into vapor, which buoys the drop up, without allowing it to touch the iron. This is what is called the spheroidal condition of water.

Why does a laundress put a little saliva on a flat-iron, to know if it be hot enough? Because, when the saliva sticks to the hox, and is evaporated, she knows it is not sufficiently hot; but when it runs along the iron, it is.

Why is the flat-iron hotter, if the saliva runs along it, than if it adheres till it is evaporated?—Because when the saliva runs along the iron, the heat is sufficient to convert the bottom of the drop into vapor; but if the saliva will not roll, the iron is not sufficiently hot to convert the bottom of the drop into vapor.

**EAU DE COLOGNE.**—Competent authorities declare that the excellence of this perfume almost entirely depends upon the purity of the spirit employed as its basis. Spirits made from malt and other materials not vinous will never produce Eau de Cologne of a high character, owing, it is believed, amongst other causes, to the odor of fusil oil in the first and to cyanic ether in the second. Neroli, without which neither genuine Eau de Cologne nor a good imitation of it can be made, is an essence obtained from orange blossoms (the bitter species, *Citrus bigaradia*), and hundreds of tons of flowers are plucked and consumed for the purpose.

**TANNING COTTON.**—*Cosmos* speaks of treating cotton fabrics with a solution of tanning to give them strength and resistance to moisture. Nature thinks the change produced cannot be great. In a subsequent number the last named journal gives a communication from a Northumberland tanner, who says that in that neighborhood the fishermen have for many years been in the habit of tanning their sails and nets with oak bark or cathechu. "Not only does it render them more durable, but in some cases where wet nets have heated and become tender, their toughness has been restored by tanning."

**DIAMOND FIELDS OF AFRICA.**—The official report first published in England declares the invoice of diamonds from South Africa to be 141 stones, worth \$37,000, for 1869; and 5,661 stones, worth \$625,000, for 1870. Besides this, there should be added some valuable gems found, as the Star of South Africa and a few others, worth \$75,000; total for 1870, 700,000. The dealers in diamonds in London and Amsterdam, however, declare that most of all the stones thus far found in South Africa are of inferior quality and do not compare with those obtained from other sources.

**J. H. HALLENBECK** suggests for photographers the use of thin sheet rubber instead of yellow glass for the sensitizing room. Light admitted through this rubber will not act on the sensitive plates.

**THE TEA TRADE.**—During the past year 15,000,000 pounds of tea were shipped East by rail from San Francisco.

## GOOD HEALTH.

## The Human Ear.

## A Minute Description of it.

It would appear that all our hearing is done in a very literal sense under water, as shown by the following extract from a London paper:

"Prof. Tyndall concluded one of his recent lectures by giving a minute description of the human ear. He explained how the external orifice of the ear is closed at the bottom by a circular tympanic membrane, behind which is a cavity known as the 'drum'; the drum is separated from the brain by two orifices, the one round and the other oval. These orifices are closed by fine membranes. Across the cavity of the drum stretches a series of four little bones, one of which acts as a hammer, and another as an anvil. Behind the bony partition, which is pierced by the two orifices already mentioned, is the extraordinary organ called the labyrinth, filled with water; this organ is between the partition and the brain, and over its lining membrane the terminal fibres of the auditory nerve are distributed. There is an apparatus inside the labyrinth admirably adapted to respond to these vibrations of the water which corresponds to the rates of vibration of certain 'bristles,' of which the said apparatus consists. Finally, there is in the labyrinth a wonderful organ, discovered by the Marches Corti, which is, to all appearance, a musical instrument, with its cords so stretched as to accept vibration of different periods, and transmit them to nerve filaments which traverse the organ. Within the ears of men, and without their knowledge or contrivance, this lute of 3,000 strings has existed for ages, accepting the music of the outer world, and rendering it fit for reception by the brain. Each musical tremor which falls upon the organ selects from its tensioned fibres the one appropriate to its own pitch, and throws that fibre into unisonant vibration. And thus, no matter how complicated the motion of the external air may be, these microscopic strings can analyze it, and reveal the constituents of which it is composed; at least such are the present views of those authorities who best understand the apparatus which transmits sonorous vibrations to the auditory nerve."

**SLEEPLESSNESS.**—The best anodyne is a liberal amount of muscular activity out of doors every day. Persons who sit around the fire and lounge on the sofa, or read or sew a great part of the day, need not expect sound sleep; only the laboring man can taste it in all its sweetness.

Many fail to sleep at night because they will persist in sleeping in the day time. It is just as impossible to healthfully force more sleep on the system than the proportion of exercise requires, as to force the stomach to digest more food than the body requires. Rather than court sleep by industrious activities, many persons resort to medicine, and every new drug which is heralded as a promoter of sleep becomes at once immensely popular, even though it is known to possess dangerous qualities.

Chloral hydrate has had a great run, and even young men are known to be purchasing it at the drug stores, to be used in promoting sleep; it should never be taken unless advised by the family physician, for the medical journals are constantly publishing cases where serious harm and even fatal results attend its habitual use.—*Journal of Health.*

**WHY THE COLOR OF BLOOD CHANGES.**—The cause of the change of color in blood—darkening when exposed to carbonic acid, and brightening when under the influence of oxygen—is not as yet thoroughly understood. It is thought, however, that the red corpuscles contained in the blood are rendered flatter by oxygen gas, while they are distended by the action of carbonic acid. It is not improbable that under the former circumstances they may reflect the light more strongly, and thus give a more distinct coloration to the blood; while, under the latter, they may transmit more light and so allow the blood to appear darker and duller. Both of these theories have able advocates.

**QUININE** has been found to be excessively poisonous to some persons for whom it has been prescribed, producing fever, and a very irritating rash upon the skin, which resembles somewhat that of scarlatina or measles, in appearance.

## Earth-Eaters.

A tribe at the mouth of the Amazon, say two recent travelers, whose veracity, we are told, can be relied upon, content themselves, or at least try to do so, with a fatty, ferruginous earth, of which they eat about a pound and a half a day. Nor is this the only place where this earth can be obtained, nor is its use confined to those who are unable to obtain any thing better. In Bolivia, for instance, an earth of this kind is sold in the public market, an analysis of which yields the following results: Every variety of these earths is almost entirely composed of fresh-water infusores, or microscopic shells. Their nutritive properties, therefore, are doubtless owing to the retention of animal substances by these shells, which thus constitute a species of antediluvian snoutenace. It is not only, however, in the South that this kind of nutriment is made use of; in a country where warmth is of the first necessity, namely, Lapland, the inhabitants make use of a white mineral, in the absence of cereals. This dust is composed of nineteen species of infusores analogous to those found in the neighborhood of Berlin. In testing this skeleton dust, which is found in considerable quantities in Sweden and Finland, as well as in Lapland, Retzius discovered that it contained a large proportion of animal matter.

**THE NEW STIMULANT.**—Chloral drinking, according to the physicians, is superseding absinthe, opium and alcoholic stimulants among the better classes. An insidious sedative, its use grows more dangerously on the tippler than more actively intoxicating drinks. The manufacture of this drug is the best evidence of the extent of its use. In Europe its production has become one of the leading chemical industries, and it is sold by the ton. Baron Liebig affirms that one German chemist manufactures and sells half a ton a week. The London *Spectator* says: "Taking chloral is the new and popular vice, particularly among women, and is doing at least as much harm as alcohol. The drug is kept in thousands of dressing-cases, and those who begin its use often grow so addicted to it that they pass their lives in a sort of contented stupefaction. Chloral drunkards will soon be an admitted variety of the species."—*Philadelphia Press.*

**CURIOUS FACTS.**—Every day brings additional proof of the superiority and greater power of endurance of medium-sized men for infantry. In answer to the question, Are you tougher and more vigorous than when you enlisted? the large, tall man almost universally answers that he is much less so; while, on the contrary, those of small or medium size, including many students and in-door mechanics, often of slender form, generally answer that they are stronger and much healthier than before they enlisted. The simple diet of the army, and pure air of tent life, invigorates them; besides, they probably take better care of themselves than large, strong men are apt to do. The last feel confident in their strength, and neglect sanitary measures.

**BEE STINGS.**—Very serious consequences sometimes arise from bee stings. The *Rural World* relates the following:—On Monday afternoon, Mrs. Wm. E. Sutliff was stung on the forehead by a bee, and instantly went into spasms. For two hours her life was despaired of, but yesterday her face commenced swelling rapidly, and last night she was much better.

These effects of stings depend quite as much upon the constitutional habit of the party as anything else. We have tried a solution of carbolic acid, one part of acid to sixty of water, and found it an almost instant and unfailing remedy.

**INSPIRATION AND EXPIRATION.**—If an adult man, breathing calmly in a sitting position, be watched, the respiratory act will be seen to be repeated thirteen or fourteen times every minute. Each act consists of certain components which succeed each other in regular rhythmical order. First, the breath is inspired, or drawn in; immediately afterward it is expired, or driven out; and these successive acts are followed by a brief pause. At each inspiration in a well-grown adult, about thirty cubic inches of air are inspired, and about the same or a slightly smaller volume expired.

At an anti-vaccinationist meeting recently held in Manchester, the resolution "That vaccination does not prevent small-pox, but doubles disease and death," was unanimously adopted.

A NEW GUIDE.—D. M. Bishop & Co., 512 Clay street, have just issued the first number of "The San Francisco Quarterly Trades' Guide and Merchants' Directory." It contains a pretty complete classified list of business, trade and professional firms, and their locations in the city, with an alphabetical index. Being issued quarterly, with the business changes corrected, makes it a convenient and useful publication.

## Hints to Miners.

## Lodes.

Miners are all familiar with the term "fissure vein;" and although many of them may have had some practical demonstration that it is frequently misapplied, they may not yet know to a certainty the principal characteristics by which to determine them, or the correct meaning of the term. Mr. Raymond, in his report on American mines and mining, gives the following definition and conclusions:

A lode is a fissure in the earth's crust, filled with mineral. The terms vein, lead, ledge and reef are used indifferently for the same thing; but all these terms are frequently applied vaguely or incorrectly to sheet deposits, which are not lodes. Thus, we hear of veins of coal; and in the common usage of miners, everything is a "lodge" which has been "located." The distinction between lodes and beds is, however, really the sharpest and most positive in the whole classification of inclosed deposits.

All lodes are fissure-lodes, even those running parallel with the stratification of the inclosing rocks, or occurring along the contact of two different rock-formations. The definition given above includes those cases, as will be shown by more clearly considering the radical distinction between lodes and beds. The latter are generally (but not always exactly) parallel with the inclosing rocks, and amount to nothing more in most cases than layers of the regular formation, differing in their contents more or less from the earlier layers under them and the later layers above them. In some instances the parallelism is only general. The beds widen and thin out, and on that account are sometimes held to be lodes, especially if steeply tilted. But this irregularity is common enough in all stratified rocks.

The test question deciding between a bed and a lode turns on the definition already given. A bed never is, and a lode always is, a deposit effected between already existing rocks, and, therefore, of later origin than the strata on either side; in other words, a fissure filled. The fissure may be across the stratification or parallel with it, or along the contact plane of two formations; it may have been filled in any one of many ways. These all give rise to different varieties of veins; but the general definition includes all, and is as clear as it is broad. We have then, at the outset, the following conclusions from our definition:

1. The form and direction of the vein are determined by the fissure.
2. The mineral contents are determined by the time, manner and material of the filling of the fissure.
3. The vein material is always later than that of the formation of the "country" or inclosing rocks.
4. Sheet deposits, intersecting a formation across the stratification, and independently of it, are certainly lodes; but all lodes need not necessarily take that direction.
5. Lodes parallel with the stratification are not so easily recognized, because they may be confounded with beds; but when they are proved to consist of material later in origin than the rocks on either side, and deposited in a seam or opening between them, whatever may be its direction or dimensions, they must be considered as lodes; the same is true of "contact" lodes.
6. There are, however, contact beds, layers between two formations, differing from both, but formed in the regular series of time as well as position, to which both belong. These are not lodes.

THE LEGISLATURE.—Both Houses of the Legislature, after the transaction of some unimportant business on Friday 21st inst., adjourned until January 4th.

## Hoisting Cage, with Self-adjusting Bottom.

It is consistent to suppose that any improvement whatever in mining cages is looked to with interest by all connected with the business of mining, not only where it ensures an increase of safety, but also where it relates to convenience and saving of time in loading, etc. The old system of wooden buckets and manilla rope has been entirely abandoned in mines that make any pretension of being permanently worked, and iron safety cages with wire rope have been substituted, and by degrees other improvements have been introduced. If a stone, a timber or a tool falls, the covering of the cage protects the

men; and if by any accident the rope breaks, the safety clutches spread their protecting arms, and keep the cage suspended until the breakage has been repaired. And now comes a new improvement, which is designed to overcome an existing difficulty when the shaft is not

exactly perpendicular, and the cage is made to suit its inclination.

In mines where cages are used in hoisting, the cages are made to suit the angle of the shaft at the surface landing, so that the bottom will be on a level at that angle. As the cages now in use are one rigid piece of work, it will easily be seen that where the shaft at any of the levels varies from the angle at the surface, the cage will not sit level. The way in which the difficulty has heretofore been overcome was by cutting away the walls of the shaft and putting in curves, so as to land the cage at the angle that it started from at the surface. That system is both troublesome and expensive, and it is this trouble and expense that the Self-adjusting Cage Bottom is intended to obviate.

By referring to the accompanying cut

the manner in which this improved cage works will be seen. Fig. 1 gives a view of the cage as it stands on the surface landing. The cage being made to suit the angle at the starting point, the self-adjusting bottom c. c. rests on the frame of the cage e. e.

Fig. 2 shows the cage at a landing underground, where the angle of the shaft has varied from that at the surface. The block B is fastened upon the timber upon which the cage rests, and in proper position to receive the free end of the adjustable bottom. As the cage settles down, this block lifts the lower end of the adjustable bottom to a level position so as to allow the cars to run on or off as desired.

Mr. James W. Korr of Grass Valley, Cal., the inventor of this device has taken steps through the Scientific Press Patent Agency to secure protection for his invention.

## The Advantages of Shipping Ores.

Mr. J. S. Phillips in his new work, the "Explorers, Miners, and Metallurgists companion," gives a few reasons why miners should more generally prefer to sell their concentrated ores even to metallurgical companies at a great distance rather than to reduce them at the mine. In many parts of the country smelting ores are now sent away, principally to England, for reduction. In speaking of the advantages which the English possess over this comparatively new country in this respect, Mr. Phillips says:

"Take as an example for palpable illustration of this subject any one of the large smelting works of South Wales, which are located either in or close to the coal and metal supplying sea-port towns, which have steadily increased in size and importance to accommodate the vast requirements of those gigantic firms, who have in a manner, educated the whole community of men, women and children to suit their particular manipulative purposes, for the production of coals, and reduction of minerals to supply the metals to the whole world.

They have started from the very commencement of modern metallurgy, and from their own and other people's inventions, have so improved the chemistry of smelting, and secured the general confidence of the commercial world, that they can both command and supply all markets for the following salient reasons:

1. They have the most skilful supervisors that can be obtained,
2. A superabundance of capital.
3. An ample supply of cheap, educated operatives.
4. Coals, fireclay and brick of the finest quality at merely nominal prices.
5. Natural, costless chimney draught, and "reverberatory furnaces."
6. Many furnaces, for occasional repairs when required for different treatment of peculiar ores.
7. Regular and cheap (return freight) supplies of all the varieties of minerals and matrices, from all parts, at home and abroad.
8. Systematic choice and assortment from all ores, to suit the ore that is being smelted, so as to improve the refractory by a more fusible and smeltable ore; or to enrich a smeltable lead by non-smeltable gold or silver ores; or by adding anti-monial ore to lead to produce more alloy, for peculiar markets; or adding one constitutional form of ore to another, to produce certain chemical changes that may be desired during roasting, etc.
9. Smelting some tractable ores for pure metals, to supply as such.
10. Smelting other more mixed and refractory ores for certain other markets, where purity is not essential.
11. Smelting mixed minerals, for alloys, to be sold as such for certain purposes, as copper mixed with tin or zinc, for bell metal, hearing brasses, brass, etc.
12. Humid reductions for the separate

simultaneous precipitation of the artificial and marketable base minerals, and the silver and gold for their individual markets.

13. A perfect knowledge and command of all the various requirements of trade, as well as where and when required; which is in itself an amazing advantage.

These are some few of the reasons why the miners and even metallurgists of this country will not be able to compete with such firms (at least for sometime to come) in the reduction of refractory minerals into metals.

The cost of ocean freight (supposing the miner obtains a reasonable and just price for his ore) is a mere cipher against such advantages, coupled with your disadvantageous circumstances.

In many cases it will, therefore, be much better to reduce the weight by suitable means for cheaper conveyance by land and water than to complete the whole reduction into metal on the mine.

The many other adverse local reasons need not be portrayed, as they are already sufficiently well known to those mining and business men who have too hastily endeavored to run such unequal races.

The low-grade copper ores of Cornwall, which average from five to six per cent., are not smelted in the mines, but sent to South Wales, as return freight, at about from five to six shillings per ton, in the vessels that bring coals for the steam engines and domestic purposes of that county.

A respectable general firm is already needed, and will be much more required in the city of San Francisco, for the judicious treatment of the various ores of the Pacific Coast, and such a company should either be a feeding branch of one of these larger establishments or be fully prepared to either sell some of their ores in a crude state, simply roasted, or partially smelted into regulus; whilst others may be smelted into commercial alloys or into pure metals to for the different markets.

Such a firm, if well and honestly conducted, would be mutually advantageous for the country, the miner and itself; for millions of tons might then be mined and sold, by comparatively poor men, at paying prices, which at present conditions must lie unrealized.

The day cannot be far distant when such an establishment will be in operation, but it will not be complete unless it has these facilities, and also the milling, chlorinizing and purely chemical treatments, so that every kind of ore may be benefited to suit all circumstances and markets after the best possible methods.

These different operations may be accomplished by small firms for each separate manner of treatment; but, lacking the miner's confidence and the above general advantages of one complete establishment, they will but serve the exceptional rather than the general requirements of miners, for some direct and especial object of the local manufacturer."

## Emerson's Stone Saw—Important Invention.

Your readers are familiar with the movable teeth timber saw, first introduced in California by James E. Emerson, and now in general use. Mr. Emerson has invented a saw of similar principles, which is designed to walk through marble and granite with less speed, but with every other advantage that is possessed by his timber saw.

The mode of fastening the teeth is an improvement, for the rest everything depends upon the material and the temper of the teeth, according to the hardness of the stone. For granite and porphyry, carbon points are preferable; but very great improvement has been made at Troy in the steel designed for such work, which makes it about equal to black diamonds.

The cutting teeth are made equally sharp at both ends; and when one end dulls, the other is turned up in an instant. After a full test, the leading master mechanics of Pittsburgh subscribed \$200,000 to erect works and manufacture these saws, under Emerson's supervision.

Already the stone factory is completed at Beaver Falls, Alleghany Co., Penn., and the works are being constructed. The invention has been disposed of in Great Britain to a very large marble house, which, after careful study of its merits became convinced that it would displace the present slow and costly method of dealing with marble and other quarry productions.

We are proud to claim Mr. Emerson as an old Californian. He is a brother of Professor Emerson of Oakland. J. S.

12v23-3m **J. W. TAYLOR, Agent.**

**FARMERS and MECHANICS**

Are especially invited to call and see a Model of the

**Self-Opening and Self-Closing Gate,**

The Simplest and Most Practicable now in use.

—ALSO THE—

**Verticle and Straight Mould-Board Plow,**

Which is Cheaper of Construction, opens its furrow  
Wider and Cleaner, and with 30 per cent.  
Less Draft than ordinary Plows  
of the same cut.

These Plows are being manufactured TO ORDER by  
**HILL & KNAUGH,** of Marysville, and S. CONRAD, of  
Petaluma. Rights for sale by

**WIESTER & CO.,**

No. 17 New Montgomery St., San Francisco, Cal.

**THE C-SPRING ROLLER SKATE,**  
**PATENTED 1871.**

**Rights and Skates for Sale.**

This superior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping  
Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

**This Skate is Positively no Infringement**

of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following  
points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating  
floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

**START A RINK,**

Should examine and test this Skate. Sample pairs sent C. O. D. on application.

For City, County or Rink Rights, call on or address **WIESTER & CO.,**  
21v23-4t No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.

**THE GIANT POWDER COMPANY**

Are now manufacturing besides the famous regular

**GIANT POWDER, A NO. 2 GIANT POWDER,**

Somewhat slower in its Explosion, which we recommend for

**BANK BLASTING, COAL MINES,**

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

**BANDMANN, NIELSEN & CO.,**  
General Agents, No. 210 Francisco Street.

**HILL'S PATENT**  
**EUREKA GANG PLOW,**

The undersigned, Manufacturer of "HILL'S PAT-  
ENT EUREKA GANG PLOWS," take this method of  
calling the attention of Agriculturists throughout the  
Pacific States and Territories to the merits of the above  
named Plows, and offer the following reasons why they  
are entitled to preference over any other Plow in use.

They are made of the best material, and every Plow  
warranted.  
They are of light draught, easily adapted to any  
depth, and are very easily handled.

They will plow any kind of soil, and leave the ground  
in perfect order.

**FIRST PREMIUMS!**

These Plows took the First Premium at the State Fair  
in Sacramento, in 1870; at the Northern District Fair in  
Marysville, 1870 and 1871; and at the Upper Sacramento  
Valley Fair, Chico, 1870 and 1871. At the Mechanics'  
Fair, held in San Francisco in 1871, a Silver Medal was  
awarded these Plows; and the State Agricultural Soci-  
ety, at the last Fair, offered a premium of \$40 for the  
best Gang Plow. The committee was composed of  
practical farmers from the agricultural counties, who,  
after a fair test and thorough competition with the  
leading plows of the State, awarded the premium to the  
Eureka Gang Plow. From this it will be seen that  
these celebrated plows still maintain their reputation  
over all competitors. Patented Sept. 7, 1869.

**Champion Deep-Tilling Stubble Plow,**

which took the First Premium over all competitors at  
the State Fair, 1871. It turns a furrow 14 inches deep  
and 24 inches wide.

This Gang Plow combines durability with cheapness,  
being made entirely of iron by experienced workmen,  
of the best material. Over three hundred are now in use,  
and all have given entire satisfaction.

Manufactured and for sale at the corner of Third  
street and Virgin Alley, Marysville, by

**HILL & KNAUGH,**

And also by most leading Agricultural Dealers in the  
State. All others are invited to apply at once for  
Circulars, prices, etc. 16v23-tf

GILKS D. GRAY.

**The California Powder Works**

No. 314 CALIFORNIA STREET,  
SAN FRANCISCO.

Manufacturers and have constantly on hand

**SPORTING,**  
**MINING,**  
**AND BLASTING**  
**POWDER,**

OF SUPERIOR QUALITY, FRESH FROM THE  
MILLS. It being constantly received and transported  
into the interior, is delivered to the consumer within  
a few days of the time of its manufacture, and is in every  
way superior to any other Powder in Market.

We have been awarded successively

**Three Gold Medals**

By the MECHANICS' INSTITUTE and the STATE AG-  
RICULTURAL SOCIETY for the superiority of our  
products over all others.

We also call attention to our

**HERCULES POWDER,**

Which combines all the force of other strong explosive  
now in use, and the lifting force of the best blasting  
powder, thus making it vastly superior to any other  
powder now in use.

A circular containing a full description of this Pow-  
der can be obtained on application to our Office.  
16v20-3m **JOHN F. LOHSE, Secretary.**

**THE CALIFORNIA**  
**Safety Gas Lamp.**

This New Gas Lamp takes the  
place of the Candle, the Coal Oil  
Lamp and Coal Gas, and costs only

**One-Half Cent per Hour.**

Any person who will take the  
trouble to examine this Lamp care-  
fully, will see that it WILL NOT EX-  
PLODE.

The flame is as white and brilliant  
as coal gas, and produces neither  
Smoke nor Smell. No CHIMNEY IS  
REQUIRED.

It makes its own gas as fast as it is required, and when  
the light is blown out the gas ceases to be generated.

**One Burner is Equal to Six Candles.**

This Lamp burns Refined Petroleum, Gasoline, Den-  
torth's Oil or Taylor's Safety Fluid. Oil expressly pre-  
pared for the Lamp furnished by the undersigned in  
quantities to suit. **WIESTER & CO.,**  
17 New Montgomery street, Grand Hotel, S. F.

**LEA & PERRINS'**  
CELEBRATED  
**Worcestershire Sauce.**

Declared by Connois-  
seurs to be the only good  
SAUCE. The success of  
this most delicious and  
unrivalled Condiment  
having caused certain  
dealers to apply the  
name of "Worcestershire Sauce" to their  
own inferior compounds, the public is  
hereby informed that the only way to  
secure the genuine is to ask for LEA &  
PERRINS' SAUCE, and see that their  
names are upon the wrapper, labels,  
stopper and bottle.

Some of the foreign markets having  
been supplied with a spurious Worcester-  
shire sauce, upon the wrapper and labels  
of which the names of Lea and Perrins have been  
forged, L. and P. give notice that they have furnished  
their correspondents with power of attorney to take in-  
stant proceedings against manufacturers and vendors of  
such, or any other imitations by which their right may  
be infringed.

Ask for LEA & PERRINS' Sauce and see name on  
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-  
ter; Crosse & Blackwell, London, &c., &c., and by  
Grocers and Oilmen universally. Agents, CROSBY &  
CO., San Francisco. 1v22-1yeov

**Longshore's Combination Tool.**

This device is just what its name indicates. As a  
KITCHEN TOOL it is indispensable. It will fit and lift  
with perfect safety, any Stove Lid, Frying Pan, Pie Pan,  
Pot, Kettle, or any other vessel or dish used about a  
stove. It is a complete tool for stretching carpets,  
driving tacks, pulling tacks, &c., &c. It answers the  
double purpose of hammer and pincers, and is also a  
good Nut Cracker. It is made of the best malleable  
iron, and the Hammer, Pincers and tack puller, are all  
hardened so as to stand the roughest usage. An Agent  
is wanted in every town on the Pacific Coast to sell this  
valuable little implement. Retail price fifty cents.

UNION PACIFIC RAILROAD.

Running from Ogden, Utah, to Omaha, Nebraska—over  
one thousand miles, without change of cars.

MAKING DIRECT CONNECTIONS

AT OGDEN with the CENTRAL PACIFIC R. R. (from San  
Francisco); also with the Utah Central R. R. to Salt Lake  
City.

AT CHEYENNE with the DENVER PACIFIC R. R., for  
Denver City and the Mining Districts of Colorado.

AT OMAHA, for Chicago, Eastern and other cities, with  
the Chicago and Northwestern; Chicago, Rock Island and  
Pacific; Burlington and Missouri River; St. Joseph and  
Council Bluffs Railroads; also, for St. Louis and all South-  
ern cities.

EXPRESS TRAINS RUN DAILY.—The U. P. R. R. use  
the Westinghouse patent air brake; Miller's patent improved  
platform and elastic car-coupler; and the most approved  
construction of cars for the comfort and safety of passen-  
gers.

PULLMAN'S MOST MAGNIFICENT PALACE SLEEP-  
ING CARS attached to express trains.

T. L. KIMBALL,  
General Passenger Agent, Omaha.

LUBRICATING OIL,

THE BEST IN THE WORLD!

The attention of the public is called to GRUBER'S  
NEW PATENT LUBRICATING OIL.

For running Machinery of all kinds it has no equal.  
It will not gum, and runs perfectly smooth, cool and  
clean.

This OIL offers special inducements to Farmers,  
Livery Stable Keepers, etc.

It will be found far Superior

To any other Oil or Grease now in use, for Carriages  
Wagons, and all kinds of Farming Machinery.

Mill-men, Printers, and all others having occasion to  
use a Lubricator, will find a decided advantage in using  
this Oil—one gallon being equal to two of the best Oil  
in the market.

Perfect Satisfaction Guaranteed

OR MONEY REFUNDED.

Orders per Mail or Express will receive prompt at-  
tention.

## The Scientific Press for 1872 Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXIV.

The weekly issues of the Press will contain reliable

### Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

### For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

### Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

### For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

### Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professions, scientific men," but rather a

### Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

### The New and Novel Developments

In the progress of this comparatively new section of the Union, but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe, enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

### Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

### A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Our community is not so numerous or our field so thickly settled as the Eastern States and Europe, consequently we wish each friend of our enterprise to bear in mind the greater importance of his individual patronage, and also the value of

### Speaking a Good Word

For the Scientific Press to those who are not, by personal acquaintance, familiar with its more than ordinary value and merits.

No intelligent reader will regret sending his subscription without delay. A trial is not expensive.

Subscriptions, payable in advance—\$4 per annum. Single copies, post-paid, 10 cents. Address

DEWEY & CO.,

Publishers, Patent Agents, and Engravers, No. 338 Montgomery St., S. E. Corner California, S. F.

## Scientific and Practical

### BOOKS

### MINING, METALLURGY, ETC.

BY GUIDO KUSTEL

MINING ENGINEER AND METALLURGIST.

Published and Sold by

DEWEY & CO.

### Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-Silver.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price \$2.50 coin, or \$3 currency, postage free.

### Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in any other work. It is liberally illustrated with instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

### Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

### WORKS BY OTHER AUTHORS.

**The Explorers', Miners' and Metallurgists' Companion;** comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 840 Pages and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, \$10 (in cloth or its equivalent). In leather, \$12. Postage, 50 cents extra. Issued and for sale by DEWEY & CO., Patent Agents and Publishers Scientific Press, S. F.

**Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked;** with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & CO. Price, \$1; postage free. The best treatise on the subject, and most complete work on the subject treated.

**The Quartz Operator's Hand-Book;** by P. M. Randall. Revised and Enlarged Edition. Sold Wholesale and Retail, at publishers' rates, by DEWEY & CO., Proprietors, Scientific Press, Patent Agents, Engravers and Publishers, San Francisco. Cloth bound, 175 pages. Price, \$2.

### Practical Mining and Metallurgy.

The Explorers', Miners' and Metallurgists' Companion is the title of a new book on practical mining, by J. S. Phillips, M. E., which has just been issued by Messrs. DEWEY & CO. of the Scientific Press. It is divided into five sections.

The first section contains eight chapters, the first three of which are written to give the practical man general ideas of the three ages of rock formations, and the last five chapters give elaborate descriptions of the formations and peculiarities of veins, pockets, etc., the formation of minerals, and all of the well established indications for valuable deposits, which are both interesting and valuable.

The second section on exploration, shows "How to Prospect," "Where to Prospect," "What Formation to Seek," "What to Avoid," and "How to Examine the Vein."

The third section on assaying contains fifteen chapters. The first minutely describes the preparation of the sample, etc., which is very important when accurate assays are required. The third chapter gives new and useful water treatment methods for examination and assaying of minerals. The fourth gives general methods for examination. The fifth contains new means for practical men to discriminate all the useful minerals by ordinary facilities. The sixth is an alphabetically arranged chapter for discrimination by all ready means.

These chapters are likely to be of service for such men as will require this book, while the remaining nine chapters give a great variety of the more available and safe methods for assaying all of the useful minerals. The fourth section is on the mining and engineering of deep mines, where the author has described the many minute details of how the shafts and levels should be excavated, the machinery placed, etc., for deep mining, from which many will derive important information.

The fifth and last section describes the best methods for beneficiation of minerals by roasting, smelting, milling, chloridizing and chemical means. In the several sections the work is eminently practical; and although many passages are severe on illegitimate mining, the author's intentions for improving the future should be at least respected. The work is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—Daily Examiner, Dec. 21st.

**The Fruits and Fruit Trees of America,** or the Culture, Propagation, and Management, in the Garden and Orchard, of Fruit Trees generally, with descriptions of all the finest varieties of Fruit, Native and Foreign, cultivated in this country. By A. J. Downing. Illustrated; 1688 pages; 1869. The best authority, and only complete work. Price, in cloth and gilt, \$5, post paid, by DEWEY & CO., this office.

It is one of the largest, best illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the western side of the Continent. Its circulation is rapidly increasing, and it is very Popular with its Patrons.

### A NEW HUSBANDRY,

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, to be observed with interest, and read, as reported in the PACIFIC RURAL, with profit by practical and progressive agriculturists everywhere. Sample copies of the Press, post paid, 10 cts. Subscription, \$4 a year.

DEWEY & CO., Publishers,

No. 338 Montgomery St., San Francisco, Cal. Nov., 1871

### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. H. MURRAY—General Traveling Agent.  
C. H. DWINE—Special Corresponding Agent.  
I. N. HOAG—Sacramento, General Agent.  
F. M. SALAY—San Diego, General Agent.  
L. F. MCCARTY—California.  
M. B. STARR—Pacific Coast.  
A. C. KNOX, City Soliciting and Collecting Agent.

### Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to buy colorized by advertising in a MINING JOURNAL, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

GIVE YOUR OLD ADDRESS when you want the paper sent to a new one. We cannot afford to look over several thousand names to stop it at the former P. O.

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of Maravilla Cocoa. Their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage. Sold in packets only by all Grocers of their use. Also, by Taylor Brothers, Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 1623-17

**UNIVERSITY OF CALIFORNIA.**—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. 899ptf

\$5 to \$20 PER DAY and NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

**LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine** against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York. Good work at high prices if desired. 21v1-12mbp

**CONTINENTAL Life Insurance Co.,** 302 Montgomery street, corner of Pine.

### STEAM POWER.

The second and third stories of the west half of the Mechanics' Mill, corner of Mission and Fremont streets, to let, with Steam Power. Frontage about 70 by 127 feet, but the rear half is only about 40 feet wide. To be let in whole or in part, to one or more tenants. For further particulars apply to

FRANK KENNEDY,

26v23-1m

604 Merchant street, San Francisco.

**JOHN TAYLOR & CO.,**  
IMPORTERS OF AND DEALERS IN  
**ASSAYERS' MATERIALS,**  
Chemical Apparatus and Chemicals,  
Druggists' Glassware and Sundries,  
PHOTOGRAPHIC GOODS, ETC.,  
512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

### ASSAYERS' MATERIALS

Chemical Apparatus,  
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

### WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.  
Assay Balances—Becker & Sons, Antwerp.  
Chemical Balances—Becker & Sons, Antwerp.  
Ore or Pulp Balances—Becker & Sons, Antwerp.  
Assay Weights—Grains and Ounces.  
Bullion Balances and Weights.  
Humid Assay Apparatus.  
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.  
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian or Sand Crucibles.  
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.  
Assayers' and Chemical Glassware and Assayers' Hardware a full assortment.  
Steel Stamps for hoes cut to order.

### ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.  
Bi Carb. Soda, Borax, Bone Ashes, Litharge.  
Assay Lead in bars, rolled and granulated.  
Black Oxide Manganese, Sodium and Sodium Amalgam, Salts of Copper, Silver, and all Chemicals and Reagents required by Assayers and Milling Co's.  
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-4f JOHN TAYLOR & CO.

### THE MOST ASTONISHING Agricultural Machine of the Day.

IT WORKS TO A CHARM.

### WITH ONE HORSE POWER. Phillips' Patent Corn Husker.

Now for Sale in the Pacific States.

It took Six Premiums in the East in 1871, and a Diploma at the State Fair, Sacramento, Cal.  
Illustrated and described in the PACIFIC RURAL PRESS, November 25, 1871. Send for Circular. Machines and rights for the Pacific States for sale by

WIESTER & CO.,

17 New Montgomery street, S.

### Phelps' Patent Animal Trap,

FOR GOPHERS, SQUIRRELS, RATS, CATYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction and not likely to get out of order, and very durable.

It is Very Efficient and can be used conveniently by women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where express charges are high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer, D. N. PHELPS, al-ly-awbp San Leandro, Alameda County, Cal

**H. M. BALCH,**  
432 Kearny St., S. E. corner of California st. (up stairs),  
SAN FRANCISCO.

### Repairs and Tunes

ALL KINDS OF  
**MUSICAL INSTRUMENTS,**  
Either Brass, Reed or String.  
Special attention given to PIANOS, ORGANS, or MELODEONS.  
Mr. B. is a practical workman of twenty-five years experience, and employs none but experienced workmen.  
ORDERS from the country attended promptly.  
8v23-3msa

### PLUMBAGO CRUCIBLES.

MORGAN'S CELEBRATED PLUMBAGO CRUCIBLES, all sizes (except 25 and 30), from No. 1 to 100, for sale low to close consignment.

22v23-3m A. S. HALLIDIE, 519 Front street, S. F.

### CAUTION.

### BETTS'S CAPSULE PATENTS

are being infringed by importation of Capsules made in contravention of his rights, which necessarily are numerous, BETTS being the original inventor and Sole Maker in the United Kingdom.  
1, WHARF ROAD, CITY ROAD, LONDON, AND BORDEAUX, FRANCE.

## Mining and Other Companies.

During the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can make in the present state of affairs.

**Alhambra Hill Mining Company—Location**

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of December, 1871, an assessment of \$100,000 of 30 cents per share was levied upon the capital stock of said company, payable in United States gold coin, on the 15th day of January, 1872, to Henry G. Lantry, 812 Clay street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 15th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. HENRY G. LANTY, Secretary. Office, No. 612 Clay street, San Francisco, Cal. dtd-1w

**Eagle Quicksilver Mining Company—Location**

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of October, 1871, an assessment of Forty (40) dollars per share was levied upon each and every share of the mines of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 3, No. 302 Montgomery street, San Francisco, Cal. Any share upon which said assessment shall remain unpaid on Thursday, January 10th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 8th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees. W. H. WATSON, Secretary. Office, Room 3, No. 302 Montgomery street, San Francisco, Cal. dtd-1w

**Kincaid Flat Mining Company—Location**

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of December, 1871, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 3, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 17th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 17th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. H. CORNELL, Secretary. Office, 220 Clay street, San Francisco, Cal. dtd-1w

**Nevada Consolidated Borax Company—Location**

Notice is hereby given, that at a meeting of the Trustees of the above named company, held November 25th, 1871, an assessment of five (5) cents per share was levied on the capital stock of said company, payable on and after the 30th day of November, 1871, in United States gold coin, to the Secretary, at the office of the company, Room 420 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on Wednesday, January 10th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold at public auction on Monday, January 20th, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. J. L. SANFORD, Secretary. Office—Room 1, 3d story, No. 420 Montgomery street, San Francisco, California, December 6th, 1871. dtd-1w

**Pocahontas Gold Mining Company—Location**

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of November, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 8th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. D. A. JENNINGS, Secretary. Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal. dtd-1w

**Quail Hill Mining and Water Company—Location**

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 19th day of December, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street (up stairs), San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 25th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 13th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. T. F. CRONISE, Secretary. Office, 409 California street, San Francisco, Cal. dtd-1w

**Seaton Mining Company—Location**

Notice—There are delinquent upon the following described stock, on account of assessment levied on the 27th day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Grogan, A. B. (not issued)		10	200 00
Hastings, B. F.....	67	10	200 00
Latham, M. S.....	60	5	100 00
Latham, M. S.....	61	5	100 00
Latham, M. S.....	63	5	100 00
Latham, M. S.....	65	4	80 00
McDonald, J. W. Trustee			
For J. W. Gashwiler.....	71	5	100 00
Pringle, Geo C.....	70	5	100 00
Scott, Ed. Trustee.....	69	5	100 00
Tevia, Lloyd.....	48	5	100 00

And in accordance with law and an order of the Board of Trustees, made on the 27th day of October, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 438 California street, San Francisco, California, on the 1st day of December, 1871, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. JOEL F. LIGHTNER, Secretary. Office, No. 438 California street, San Francisco, California. 23v23-4w

**Silver Wave Mining Company—Location**

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of December, 1871, an assessment of Three Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office. Any stock upon which said assessment shall remain unpaid on Thursday, the 25th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Friday, the 23d day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J. W. CLARK, Secretary. Office, 418 California St. San Francisco. dtd-1w

**KNOWLES' PATENT STEAM PUMP.**

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

**CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,**

SACRAMENTO, Cal., April 14, 1871.  
A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives no great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

**OFFICE OF PEOPLE'S TRANSPORTATION CO.,**

PORTLAND, Oregon, April 22, 1871.  
Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best pump in use.

Yours respectfully,

O. MARSHALL, Chief Engineer.

**OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.**

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly,

C. P. HARM.

**OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.**

Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly,

GEORGE M. REYNOLDS, Supt. Engineer.

**U. S. NAVY YARD, NEW YORK, June 3, 1871.**

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully,

W. M. W. WOOD.

**OFFICE OF THOMAS IRON WORKS, HOKENDAUQUA, Pa., June 1, 1871.**

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc.,

EDWIN MICKLEY, Supt. of Mines.

**OFFICE OF THE SAUCON IRON CO.,**

HELLSFISTOWN, Northampton County, Pa., May 26, 1871.  
Messrs. KNOWLES & SIBLEY, New York—Gentles: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given very great satisfaction, and that we like them better than any we have ever used.

Yours very respectfully,

G. W. WHITAKER, President and Superintendent.

**OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.**

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly,

P. SAULT, Superintendent.

**OFFICE OF RED BLUFF WATER WORKS, Red Bluff, June 11, 1871.**

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc.,

JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

**THE LARGEST STOCK OF PUMPS IN THE WORLD,**

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand.

24v22-eow

**Starlight Gold and Silver Mining Company.**

Location of Works: Humboldt County, Nevada.

ALSO OIL

N. Seibert's Eureka Lubricators.

**HIGHEST FAVORITE**  
Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23ff

NELSON & DOBLE,

HUGHES' PATENT

REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the ball to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use.

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and Institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.
